PREFACE.

THIS book was prepared for the use of the students in the author's classes. It has been used in lithographed sheets for a number of years in very nearly the present form, and has given satisfaction sufficient to suggest putting it in print. An effort has been made to have the demonstrations simple and direct, and special care has been given to the arrangement and the typography, in order to secure clearness and conciseness of mathematical statement. Much of the material in the earlier part of the book is necessarily similar to that found in one or more of several excellent field books, although the methods of demonstration are in many cases new. This will be found true especially in Compound Curves, for which simple treatment has been found quite possible. New material will be found in the chapters on Turnouts and on "Y" Tracks and Crossings. The Spiral Easement Curve is treated originally. The chapters on Earthwork are essentially new; they include Staking Out; Computation, directly and with Tables and Diagrams; also Haul, treated ordinarily and by Mass Diagram. Most of the material relating to Earthwork is not elsewhere readily available for students' use.

The book has been written especially to meet the needs of students in engineering colleges, but it is probable that it will be found useful by many engineers in practice. The size of page allows it to be used as a pocket book in the field. It is difficult to avoid typographical and clerical errors; the author will consider it a favor if he is notified of any errors found to exist.

C. FRANK ALLEN.

BOSTON,
September, 1899.

PREFACE TO FIFTH EDITION

THE revision of this edition has been extensive. Few pages dealing with curves have escaped some change. In considerable part it has been a matter of refining or clearing up points shown by teaching to admit of improvement. A considerable amount of new material has been added and a few less important problems omitted; by rearrangement, and condensation in places, the size of the book has not been appreciably increased. The chapter on Turnouts has been almost completely rewritten; railroad practice in Turnouts has progressed materially in late years and complete revision of this chapter seemed advisable. The chapter on Connecting Tracks and Crossings has been materially extended. The chapter on Spirals has largely been rewritten and adapted to the use of the Spiral of the American Railway Engineering Association, the merits of which appeal to the author aside from the official sanction which establishes it as standard. A few, but not many, important changes have been made in the chapters on Earthwork.

It is still true that while this text was prepared primarily for students, nevertheless this book has proved to be well adapted to the requirements of the practicing railroad engineer or other engineer who has to deal with curves or with earthwork computation.

C. FRANK ALLEN.

CONTENTS.

CHAPTER I.

RECONNOISSANCE.

SECTION	PAGE
1-2. Operations in location. Reconnoissance	1
3-4. Nature of examination. Features of topography	1-2
5-6. Purposes of reconnoissance. Elevations, how taken ..	3
7-8. Pocket instruments. Importance of reconnoissance ...	4-5

CHAPTER II.

PRELIMINARY SURVEY.

9-10. Nature of preliminary. Grades.....	6
11-12. Importance of low grades. Pusher grades	7
13-16. Purposes of preliminary survey. Nature. Methods...	8-9
17-18. Backing up; alternate lines. Notes.....	10-11
19-20. Organization of party. Locating engineer	11
21-22. Transitman; also form of notes. Head chainman...	12-13
23-26. Stakeman. Rear chainman. Back flag. Axeman...	13-14
27-28. Leveler; also form of notes. Rodman	14-15
29-30. Topographer. Preliminary by stadia	16-17

CHAPTER III.

LOCATION SURVEY.

31-33. Nature of "location." First method. Second method..	18
34. Long tangents	19
35. Tangent from broken line of preliminary.....	19
36. Method of staking out location.....	19

CHAPTER IV.

SIMPLE CURVES.

37-39. Definitions. Measurements. Degree of curve	20
40-42. Formulas for degree and radius.....	21
43-44. Tangent distance T . Also approximate method.....	22

SECTION	PAGE
45-47. External distance E . Middle ordinate M . Chord C ..	23
48. Formulas for R and D in terms of T , E , M , C , I	24
49-51. Sub-chord c . Sub-angle d . Length of curve L	24-26
52-53. Fieldwork of finding $P.C.$ and $P.T.$ with example	27-28
54-55. Method of deflection angles	29
56-57. Deflection angles for simple curves	30-31
58-59. Example. Caution	32
60. When entire curve cannot be laid from $P.C.$	33
61. When transit is on curve and $P.C.$ not visible	34
62. When entire curve is visible from $P.T.$	34
63. Metric curves	35
64. Form of transit book for simple curves	36
65. Circular arcs with examples	37-39
66-67. Methods of offsets from the tangent and fieldwork	40-41
68. Method of deflection distances	42
69-70. Offsets between two curves, and for several stations ...	43
71-72. Deflection distances for curves with sub-chords	44
73. Approximate solution for right triangles	45
74. Fieldwork for deflection distances	45
75-76. Caution. Deflection distances with short sub-chord ...	46
77-84. Middle ordinates. Ordinates at any point	47-49
85. Find a series of points by middle ordinates	50
86-88. Substitute new curves to end in parallel tangents	50-52
89-90. Curve to join tangents and pass through given point. ...	52-53
91-93. Find where given curve and given line intersect	53-54
94. Tangent from curve to given point	54-55
95. Tangent to two curves	56
96-99. Obstacles in running curves	56-57

CHAPTER V.

COMPOUND CURVES.

100. Definitions. Fieldwork. Data	58
101. Given R_l , R_s , I_l , I_s ; required I , T_l , T_s	59
102. Given T_s , R_s , I_s , I ; required T_l , R_l , I_l	59
103. Given T_l , R_l , I_l , I ; required T_s , R_s , I_s	59
104. Given T_s , R_s , R_l , I ; required T_l , I_l , I_s	60
105. Given T_s , R_s , I_s , I ; required I_l , T_l , R_l	60
106. Given T_l , T_s , R_s , I ; required I_l , I_s , R_l	60
107. Given T_l , R_l , R_s , I ; required I_s , I_l , T_s	61

SECTION	PAGE
108. Given T_l, R_l, I_l, I ; required I_s, T_s, R_s	61
109. Given T_l, T_s, R_l, I ; required I_s, I_l, R_s	61
110. Given, long chord, angles, and R_s ; required I_l, I_s, I, R_l	62
111. Given, long chord, angles, and R_l ; required I_l, I_s, I, R_s	62
112. Substitute for simple curve a compound curve to end in parallel tangent	63
113. Given simple curve; required radius of second curve to end in parallel tangent	63
114. Given simple curve; required $P.C.C.$ of second curve to end in parallel tangent	64
115-118. Change $P.C.C.$ to end in parallel tangent	65

CHAPTER VI.

REVERSED CURVES.

119-124. Reversed curves between parallel tangents	66-68
125-126. Given T_1, R_1, R_2, I ; required I_1, I_2, T_2	68-69
127. Find common radius to connect tangents not parallel	69
128. Given unequal radii, and tangents not parallel; re- quired central angles	70

CHAPTER VII.

PARABOLIC CURVES.

129-130. Use of parabolic curves. Properties of the parabola	71
131-132. Lay out parabola by offsets from tangent	72-73
133. Lay out parabola by middle ordinates	74
134-138. Vertical curves; methods; lengths	74-78

CHAPTER VIII.

TURNOUTS.

139. Definitions. Number of frog	79-80
140. Find frog angle from number of frog	80
141. Split switch; description	81
142-143. Radius and lead; lengths of closure rails	82-83
144-146. Co-ordinates to curved rails. Also practical leads ...	84-85
147. Methods of laying out line beyond frog	86
148-149. Turnouts; co-ordinates of point where curve pro- duced backward becomes parallel to main track ...	87-88
150-155. Methods of connecting parallel tracks by turnouts ...	88-90

SECTION	PAGE
156-157. Stub switch turnouts.....	91
158-160. Stub switch turnouts for curved tracks	92-93
161-162. Split switch turnouts for curved tracks.....	94
163-166. Radius of turnout beyond frog from curved main track to parallel track.....	95-97
167-168. Ladder and body tracks	98-100
169. Cross-over between curved parallel tracks.....	101
170. Cross-over between straight tracks, not parallel, radii not equal.....	102
171. Three-throw or tandem split switch.....	103

CHAPTER IX.

CONNECTING TRACKS AND CROSSINGS.

172. Y tracks, definition.....	104
173-175. Y tracks connecting branch tracks.....	104-106
176. Crossing of two curved tracks	107
177. Crossing of tangent and curve.....	108
178. Crossing of two straight tracks; slip switch.....	109
179. Turnout connecting two straight tracks crossing..	110
180. Turnout from straight main track to straight branch track.....	110
181. Turnout from curved main track to straight branch track.....	111
182. Turnout from straight main track to curved branch track.....	112
183. Turnout connecting two main tracks, one straight, the other curved.....	113
184. Turnout connecting two curved main tracks.....	114

CHAPTER X.

SPIRAL EASEMENT CURVE.

185. Elevation of outer rail; necessity for spiral.....	115
186. Equations for cubic parabola and cubic spiral.....	116-117
187-189. Properties of spiral, with fundamental formulas..	118-119
190. Am. Ry. Eng. Ass'n spiral; description; formulas	120-121
191. Tangent distances, circle with spirals; example...	122-123
192. Given D_c , l_c ; required p , q , s_c	124
193. Given D_c , p ; required other data.....	124-125
194. Fieldwork for spirals and curve.....	126

SECTION	PAGE
195. Laying out spiral by offsets from tangent	127
196-197. Laying out spiral; transit at intermediate point...	128-129
198. Explanation of certain A. R. E. A. spiral formulas.	130
199. Spirals for compound curves.....	131-132
200. Lengths of spirals.....	132
201. Substitute simple curve with spirals for tangent connecting two simple curves.....	133
202-204. Substitute curve with spirals for simple curve....	134-136

CHAPTER XI.

SETTING STAKES FOR EARTHWORK.

205-206. Data; what stakes and how marked.....	137
207. Method of finding rod reading for grade.....	138-139
208. Cut or fill at center.....	139
209. Side stakes, section level; section not level	140-142
210-212. Keeping notes; form of note book.....	143-145
213-215. Cross-sections, where taken. Pass from cut to fill.-	146-147
216-217. Opening in embankment. General level notes....	147
218-221. Level, three-level, five-level, irregular sections....	148

CHAPTER XII.

METHODS OF COMPUTING EARTHWORK.

222-223. Principal methods used. Averaging end areas....	149
224. Kinds of cross-sections specified	150
225-227. Level cross-section. Three-level section, two methods.....	150-151
228-230. Five-level section. Irregular section. Planimeter	152-154
231. Comment on end area formula.....	154
232. Prismoidal formula.....	154
233. Prismoidal formula for prisms, wedges, pyramids	155
234. Nature of regular section of earthwork.....	156
235-236. Prismoidal formula applies where upper surface is warped.....	156-158
237. When sides are inclined.....	158
238. Wide application of prismoidal formula.....	158
239-240. Prismoidal correction; formulas.....	159-161
241. Correction in special cases.....	162
242. Correction for pyramid.....	163
243. Correction for five-level sections.....	163
244. Correction for irregular sections	163-164

CHAPTER XIII.

SPECIAL PROBLEMS IN EARTHWORK.

SECTION	PAGE
245. Correction for curvature.....	165-167
246. Correction where chords are less than 100 feet.....	167
247. Correction of irregular sections.....	167-168
248-249. Opening in embankment. Borrow-pits	168-170
250-251. Truncated triangular prism. Truncated rectangular prism.....	170-172
252-253. Assembled prisms. Additional heights.....	173-175
254. Compute from horizontal plane below finished surface	176
255. Series of sections along a line.....	176
256. Compute section from low horizontal line.....	177
257. Sections on steep side slope.....	177

CHAPTER XIV.

EARTHWORK TABLES.

258. Formula for use in L and K tables.....	178
259-261. Arrangement of table; explanation; example....	179-180
262-263. Table for prismoidal corrections; example.....	180-181
264. Equivalent level sections from tables.....	181
265-266. Tables of triangular prisms. Index to tables	181
267-268. Arrangement of tables for triangular prisms; example	182-183
269. Application to irregular sections.....	184

CHAPTER XV.

EARTHWORK DIAGRAMS.

270-273. Method of diagrams with discussion.....	185-186
274-275. Computations and table for diagram of prismoidal correction	187-188
276. Diagram for prismoidal correction and explanation of construction.....	188-189
277. Explanation and example of use	190
278. Table for diagram for triangular prisms.....	190
279-282. Computations and table for diagram of three-level sections	191-194
283-284. Checks upon computations.....	195

SECTION	PAGE
285. Construction of diagram: also curve of level section	195
286. Use of diagram for three-level sections.....	196
287. Comment on rapidity by use of diagrams.....	197
288. Prismoidal correction for irregular sections by aid of diagrams	197

CHAPTER XVI.

HAUL.

289. Definition and measure of haul.....	198
290-291. Length of haul, how found.....	198-199
292. Formula for center of gravity of a section.....	199
293-294. Formula deduced	200-201
295. Formula modified for use with tables or diagrams.	202
296. For section less than 100 feet.....	202
297. For series of sections	203

CHAPTER XVII.

MASS DIAGRAM.

298. Definition of mass diagram.....	204
299. Table and method of computation.....	205-206
300. Properties of mass diagram.....	207
301. Graphical measure of haul explained.....	207
302-303. Application to mass diagram.....	208-209
304. Borrow and waste studied by mass diagram.....	210-211
305. Profitable length of haul.....	211
306-307. Example of use of diagram.....	212-213
308. Effect of shrinkage on mass diagram.....	214
309. Discussion of overhaul.....	214
310. Treatment of overhaul by mass diagram.....	215
311. Further illustration of use of mass diagram	216-217

DIAGRAMS.....	218
---------------	-----

RAILROAD CURVES AND EARTHWORK.

CHAPTER I.

1. The operations of "locating" a railroad, as commonly practiced in this country, are three in number : —

I. RECONNOISSANCE.

II. PRELIMINARY SURVEY.

III. LOCATION SURVEY.

I. RECONNOISSANCE.

2. The Reconnaissance is a rapid survey, or rather a critical examination of country, without the use of the ordinary instruments of surveying. Certain instruments, however, are used, the Aneroid Barometer, for instance. It is very commonly the case that the termini of the railroad are fixed, and often intermediate points also. It is desirable that no unnecessary restrictions as to intermediate points should be imposed on the engineer to prevent his selecting what he finds to be the best line, and for this reason it is advisable that the reconnaissance should, where possible, precede the drawing of the charter.

3. The first step in reconnaissance should be to procure the best available maps of the country ; a study of these will generally furnish to the engineer a guide as to the routes or section of country that should be examined. If maps of the United States Geological Survey are at hand, with contour lines and other topography carefully shown, the reconnaissance can be largely determined upon these maps. Lines clearly impracticable will be thrown out, the maximum grade closely determined, and the field examinations reduced to a minimum. No

route should be accepted finally from any such map, but a careful field examination should be made over the routes indicated on the contour maps. The examination, in general, should cover the general section of country, rather than be confined to a single line between the termini. A straight line and a straight grade from one terminus to the other is desirable, but this is seldom possible, and is in general far from possible. If a single line only is examined, and this is found to be nearly straight throughout, and with satisfactory grades, it may be thought unnecessary to carry the examination further. It will frequently, however, be found advantageous to deviate considerably from a straight line in order to secure satisfactory grades. In many cases it will be necessary to wind about more or less through the country in order to secure the best line. Where a high hill or a mountain lies directly between the points, it may be expected that a line around the hill, and somewhat remote from a direct line, will prove more favorable than any other. Unless a reasonably direct line is found, the examination, to be satisfactory, should embrace all the section of intervening country, and all feasible lines should be examined.

4. There are two features of topography that are likely to prove of especial interest in reconnoissance, *ridge lines* and *valley lines*.

A *ridge line* along the whole of its course is higher than the ground immediately adjacent to it on each side. That is, the ground slopes downward from it to both sides. It is also called a *watershed line*.

A *valley line*, to the contrary, is lower than the ground immediately adjacent to it on each side. The ground slopes upward from it to both sides. Valley lines may be called *water-course lines*.

A *pass* is a place on a ridge line lower than any neighboring points on the same ridge. Very important points to be determined in reconnoissance are the passes where the ridge lines are to be crossed; also the points where the valleys are to be crossed; and careful attention should be given to these points. In crossing a valley through which a large stream flows, it may be of great importance to find a good bridge crossing. In some cases where there are serious difficulties in crossing a ridge, a tunnel may be necessary. Where such structures, either

bridges or tunnels, are to be built, favorable points for their construction should be selected and the rest of the line be compelled to conform. In many parts of the United States at the present time, the necessity for avoiding grade crossings causes the crossings of roads and streets to become governing points of as great importance as ridges and valleys.

5. There are several purposes of reconnoissance: first, to find whether there is any satisfactory line between the proposed termini; second, to establish which of several lines is best; third, to determine approximately the maximum grade necessary to be used; fourth, to report upon the character or geological formation of the country, and the probable cost of construction depending somewhat upon that; fifth, to make note of the existing resources of the country, its manufactures, mines, agricultural or natural products, and the capabilities for improvement and development of the country resulting from the introduction of the railroad. The report upon reconnoissance should include information upon all these points. It is for the determination of the third point mentioned, the rate of maximum grade, that the barometer is used. Observing the elevations of governing points, and knowing the distances between those points, it is possible to form a good judgment as to what rate of maximum grade to assume.

6. **The Elevations** are usually taken by the *Aneroid Barometer*. Tables for converting barometer readings into elevations above sea-level are readily available and in convenient form for field use. (See Table XI., Allen's Field and Office Tables.)

Distances may be determined with sufficient accuracy in many cases from the map, where a good one exists. Where this method is impossible or seems undesirable, the distance may be determined in one of several different ways. When the trip is made by wagon, it is customary to use an *Odometer*, an instrument which measures and records the number of revolutions of the wheel to which it is attached, and thus the distance traveled by the wagon. There are different forms of odometer. In its most common form, it depends upon a hanging weight or pendulum, which is supposed to hold its position, hanging vertical, while the wheel turns. The instrument is attached to the wheel between the spokes and as near to the hub as practicable. At low speeds it registers accurately; as the

speed is increased, a point is reached where the centrifugal force neutralizes or overcomes the force of gravity upon the pendulum, and the instrument fails to register accurately, or perhaps at high speeds to register at all. If this form of odometer is used, a clear understanding should be had of the conditions under which it fails to correctly register. A theoretical discussion might closely establish the point at which the centrifugal force will balance the force of gravity. The wheel striking against stones in a rough road will create disturbances in the action of the pendulum, so that the odometer will fail to register accurately at speeds less than that determined upon the above assumption.

A cyclometer, manufactured for automobile use, is connected both with the wheel and the axle, and so measures positively the relative motion between the wheel and axle, and this ought to be reliable for registering accurately. Many engineers prefer to count the revolutions of the wheel themselves, tying a rag to the wheel to make a conspicuous mark for counting.

When the trip is made on foot, pacing will give satisfactory results. An instrument called the *Pedometer* registers the results of pacing. As ordinarily constructed, the graduations read to quarter miles, and it is possible to estimate to one-tenth that distance. Pedometers are also made which register paces. In principle, the pedometer depends upon the fact that, with each step, a certain shock or jar is produced as the heel strikes the ground, and each shock causes the instrument to register. Those registering miles are adjustable to the length of pace of the wearer.

If the trip is made on horseback, it is found possible to get good results with a steady-gaited horse, by first determining his rate of travel and figuring distance by the time consumed in traveling. Excellent results are said to have been secured in this way.

7. It is customary for engineers not to use a compass in reconnoissance, although this is sometimes done in order to trace the line traversed upon the map, and with greater accuracy. A pocket level will be found useful. The skillful use of pocket instruments will almost certainly be found of great value to the engineer of reconnoissance.

It may, in cases, occur that no maps of any value are in existence or procurable. It may be necessary, in such a case, to make a rapid instrumental survey, the measurements being taken either by pacing, chain, or stadia measurements. This is, however, unusual.

8. The preliminary survey is based upon the results of the reconnaissance, and the location upon the results of the preliminary survey. The reconnaissance thus forms the foundation upon which the location is made. Any failure to find a suitable line and the best line constitutes a defect which no amount of faithfulness in the later work will rectify. The most serious errors of location are liable to be due to imperfect reconnaissance; an inefficient engineer of reconnaissance should be avoided at all hazards. In the case of a new railroad, it would, in general, be proper that the Chief Engineer should in person conduct this survey. In the case of the extension of existing lines, this might be impracticable or inadvisable, but an assistant of known responsibility, ability, and experience should in this case be selected to attend to the work.

CHAPTER II.

II. PRELIMINARY SURVEY.

9. The Preliminary Survey is based upon the results of the reconnoissance. It is a survey made with the ordinary instruments of surveying. Its purpose is to fix and mark upon the ground a first trial line approximating as closely to the proper final line as the difficulty of the country and the experience of the engineer will allow ; further than this, to collect data such that this survey shall serve as a basis upon which the final Location may intelligently be made. In order to approximate closely in the trial line, it is essential that the maximum grade should be determined or estimated as correctly as possible, and the line fixed with due regard thereto.

It will be of value to devote some attention here to an explanation about Grades and "Maximum Grades."

10. Grades.—The ideal line in railroad location is a straight and level line. This is seldom, if ever, realized. When the two termini are at different elevations, a line straight and of uniform grade becomes the ideal. It is commonly impossible to secure a line of uniform grade between termini. In operating a railroad, an engine division will be about 100 miles, sometimes less, often more. In locating any 100 miles of railroad, it is almost certain that a uniform grade cannot be maintained. More commonly there will be a succession of hills, part of the line up grade, part down grade. Sometimes there will be a continuous up grade, but not at a uniform rate. With a uniform grade, a locomotive engine will be constantly exerting its maximum pull or doing its maximum work in hauling the longest train it is capable of hauling ; there will be no power wasted in hauling a light train over low or level grades upon which a heavier train could be hauled. Where the grades are not uniform, but are rising or falling, or rising irregularly, it will be found that the topography on some particular 5 or 10

miles is of such a character that the grade here must be steeper than is really necessary anywhere else on the line ; or there may be two or three stretches of grade where about the same rate of grade is necessary, steeper than elsewhere required. The steep grade thus found necessary at some special point or points on the line of railroad is called the " Maximum Grade " or " Ruling Grade " or " Limiting Grade," it being the grade that limits the weight of train that an engine can haul over the whole division. It should then be the effort to make the rate of maximum grade as low as possible, because the lower the rate of the maximum grade, the heavier the train a given locomotive can haul, and because it costs not very much more to haul a heavy train than a light one. The maximum grade determined by the reconnoissance should be used as the basis for the preliminary survey. How will this affect the line? Whenever a hill is encountered, if the maximum grade be steep, it may be possible to carry the line straight, and over the hill ; if the maximum grade be low, it may be necessary to deflect the line and carry it around the hill. When the maximum grade has been once properly determined, if any saving can be accomplished by using it rather than a grade less steep, the maximum grade should be used. It is possible that the train loads will not be uniform throughout the division. It will be advantageous to spend a small sum of money to keep any grade lower than the maximum, in view of the *possibility* that at this particular point the train load will be heavier than elsewhere on the division. Any saving made will in general be of one or more of three kinds :—

- a. Amount or " quantity " of excavation or embankment ;
- b. Distance ;
- c. Curvature.

11. In some cases, a satisfactory grade, a low grade for a maximum, can be maintained throughout a division of 100 miles in length, with the exception of 2 or 3 miles at one point only. So great is the value of a low maximum grade that all kinds of expedients will be sought for, to pass the difficulty without increasing the rate of maximum grade, which we know will apply to the whole division.

12. Sometimes by increasing the length of line, we are able to reach a given elevation with a lower rate of grade. Some-

times heavy and expensive cuts and fills may serve the purpose. Sometimes all such devices fail, and there still remains necessary an increase of grade at this one point, but at this point only. In such case it is now customary to adopt the higher rate of grade for these 2 or 3 miles and operate them by using an extra or additional engine. In this case, the "ruling grade" for the division of 100 miles is properly the "maximum grade" prevailing over the division generally, the higher grade for a few miles only being known as an "Auxiliary Grade" or more commonly a "Pusher Grade." The train which is hauled over the engine division is helped over the auxiliary or pusher grade by the use of an additional engine called a "Pusher." Where the use of a short "Pusher Grade" will allow the use of a low "maximum grade," there is evident economy in its use. The critical discussion of the importance or value of saving distance, curvature, rise and fall, and maximum grade, is not within the scope of this book, and the reader is referred to Wellington's "Economic Theory of Railway Location."

13. The Preliminary Survey follows the general line marked out by the reconnoissance, but this rapid examination of country may not have fully determined which of two or more lines is the best, the advantages may be so nearly balanced. In this case two or more preliminary surveys must be made for comparison. When the reconnoissance has fully determined the general route, certain details are still left for the preliminary survey to determine. It may be necessary to run two lines, one on each side of a small stream, and possibly a line crossing it several times. The reconnoissance would often fail to settle minor points like this. It is desirable that the preliminary survey should closely approximate to the final line, but it is not important that it should fully coincide anywhere.

An important purpose of the "preliminary" is to provide a map which shall show enough of the topography of the country, so that the Location proper may be projected upon this map. Working from the line of survey as a base line, measurements should be taken sufficient to show streams and various natural objects as well as the contours of the surface.

14. The Preliminary Survey serves several purposes:—

First. To fix accurately the maximum grade for use in Location.

Second. To determine which of several lines is best.

Third. To provide a map as a basis upon which the Location can properly be made.

Fourth. To make a close estimate of the cost of the work.

Fifth. To secure, in certain cases, legal rights by filing plans.

15. It should be understood that the preliminary survey is, in general, simply a means to an end, and rapidity and economy are desirable. It is an instrumental survey. Measurements of distance are taken usually with the chain, although a tape is sometimes used. Angles are taken generally with a transit; some advocate the use of a compass. The line is ordinarily run as a broken line with angles, but is occasionally run with curves connecting the straight stretches, generally for the reason that a map of such a line is available for filing, and certain legal rights result from such a filing. With a compass, no backsight need be taken, and, in passing small obstacles, a compass will save time on this account. A transit line can be carried past an obstacle readily by a zigzag line. Common practice among engineers favors the use of the transit rather than the compass. Stakes are set, at every "Station," 100 feet apart, and the stakes are marked on the face, the first 0, the next 1, then 2, and so to the end of the line. A stake set 1025 feet from the beginning would be marked 10 + 25.

Levels are taken on the ground at the side of the stakes, and as much oftener as there is any change in the inclination of the ground. All the surface heights are platted on a profile, and the grade line adjusted.

16. The line should be run from a governing point towards country allowing a choice of location, that is from a pass or from an important bridge crossing, towards country offering no great difficulties. There is an advantage in running from a summit downhill, subject, however, to the above considerations. In running from a summit down at a prescribed rate of grade, an experienced engineer will carry the line so that, at the end of a day's work, the levels will show the line to be about where it ought to be. For this purpose, the levels must be worked up and the profile platted to date at the close of each day. Any slight change of line found necessary can then be made early the next morning. A method sometimes adopted in working down from a summit is for the locating engineer to

plat his grade line on the profile, daily in advance, and then during the day, plat a point on his profile whenever he can conveniently get one from his leveler, and thus find whether his line is too high or too low.

17. Occasionally the result of two or three days' work will yield a line extremely unsatisfactory, enough so that the work of these two or three days will be abandoned. The party "backs up" and takes a fresh start from some convenient point. In such case the custom is not to tear out several pages of note-book, but instead to simply draw a line across the page and mark the page "Abandoned." At some future time the abandoned notes may convey useful information to the effect that this line was attempted and found unavailable. In general, all notes worth taking are worth saving.

Sometimes after a line has been run through a section of country, there is later found a shorter or better line.

In the figure used for illustration, the first line, "A" Line, is represented by AEBCD, upon which the stations are marked continuously from A to D, 350 stations. The new line, "B" Line, starts from E, Sta. 102 + 60, and the stationing is held continuous from O to where it connects with the "A" Line at C. The point C is Sta. 312 + 27 of the "A" Line, and is also Sta. 307 + 13 of the "B" Line. It is not customary to restake the line from C to D in accordance with "B" Line stationing. Instead of this, a note is made in the note-books as follows:—

Sta. 312 + 27 "A" Line = 307 + 13 "B" Line.

Some engineers make the note in the following form:—

Sta. 307 to 313 = 86 ft.

The first form is preferable, being more direct and less liable to cause confusion.

18. All notes should be kept clearly and nicely in a note-book—never on small pieces of paper. The date and the names of members of the party should be entered each day in the upper left-hand corner of the page. An office copy should be made as soon as opportunity offers, both for safety and convenience. *The original notes should always be preserved*; they would be admissible as evidence in a court of law where a copy would be rejected. When two or more separate or alternate lines are run, they may be designated

Line "A," Line "B," Line "C,"

or "A" Line, "B" Line, "C" Line.

19. The Organization of Party may be as follows:—

- | | |
|----------------------------|--|
| 1. Locating Engineer. | |
| 2. Transitman. | |
| 3. Head Chainman. | |
| 4. Stakeman. | |
| 5. Rear Chainman. | |
| 6. Back Flag. | |
| 7. Axemen (one or more). | |
| 8. Leveler. | |
| 9. Rodman (sometimes two). | |
| 10. Topographer. | |
| 11. Assistant. | |
| 12. Cook. | |
| 13. Teamster. | |
- } Transit Party.
- } Level Party.
- } Topographical Party

20. The Locating Engineer is the chief of party, and is responsible for the business management of the camp and party, as well as for the conduct of the survey. He determines where the line shall run, keeping ahead of the transit, and establishing points as foresights or turning-points for the transitman. In open country, the extra axeman can assist by holding the flag at turning-points, and thus allowing the locating engineer to push on and pick out other points in advance. The locating engineer keeps a special note-book or memorandum book; in it he notes on the ground the quality of material, rock, earth, or whatever it may be; takes notes to determine the lengths and positions of bridges, culverts, and other structures; shows the localities of timber, building stones, borrow pits, and

other materials valuable for the execution of the work ; in fact, makes notes of all matters not properly attended to by the transit, leveling, or topography party. The rapid and faithful prosecution of the work depend upon the locating engineer, and the party ought to derive inspiration from the energy and vigor of their chief, who should be the leader in the work. In open and easy country, the locating engineer may instill life into the party by himself taking the place of the head chainman occasionally. In country of some difficulty, his time will be far better employed in prospecting for the best line.

21. The Transitman does the transit work, ranges in the line from the instrument, measures the angles, and keeps the notes of the transit survey. The following is a good form for the left-hand page of the note-book : —

Station	Point	Deflection	Observed Bearing	Calculated Bearing
7	⊙ + 24	33° 02' R	N 3° 30' E	N 3° 38' E
6				
5			N 29° 30' W	N 29° 24' W
4	⊙	12° 09' L		
3				
2				
1	⊙		N 17° 15' W	N 17° 15' W
0				

Notes of topography and remarks are entered on the right-hand page, which, for convenience, is divided into small squares by blue lines, with a red line running up and down through the middle.

The stations run from bottom to top of page. The bearing is taken at each setting and recorded *just above* the corresponding point in the note-book, or opposite a part of the line, rather than opposite the point. Ordinarily, the transitman takes the bearings of all fences and roads crossed by the line, finds the stations from the rear chainman, and records them in their proper place and direction on the right-hand page of the note-book. Section lines of the United States Land Surveys should be

observed in the same way. The transitman is next in authority to the locating engineer, and directs the work when the latter is not immediately present. The transitman, while moving from point to point, setting up, and ranging line, limits the speed of the entire party, and should waste no time.

22. The Head Chainman carries a "flag" and the forward end of the tape, which should be held level and firm with one hand, while the flag is moved into line with the other. He should always put himself nearly in line before receiving a signal from the transitman; plumbing may be done with the flag. When the point is found, the stakeman will set the stake. When a suitable place for a turning-point is reached, a signal should be given the transitman to that effect. A nail should be set in top of a "plug" at all turning-points. A proper understanding should be had with the transitman as to signals.

Signals from the Transitman.

A horizontal movement of the hand indicates that the rod should be moved as directed.

A swinging movement of the hand, "Plumb the rod as indicated."

A movement of both hands, or waving the handkerchief freely above the head, means "All right."

At long distances, a handkerchief can be seen to advantage; when snow is on the ground, something black is better.

Signals from the Head Chainman.

Setting the bottom of flag on the ground and waving the top, means "Give the line."

Raising the flag above the head and holding it horizontal with both hands: "Give line for a turning-point."

The "all right" signal is the same as from the transitman.

In all measurements less than 100 feet (or a full tape), the head chainman holds the end of the tape, leaving the reading of the measurement to the rear chainman.

The head chainman regulates the speed of the party during the time that the instrument is in place, and should keep alive all the time. The rear chainman will keep up as a matter of necessity.

23. The Stakeman carries, marks, and drives the stakes at the points indicated by the head chainman. The stakes should

be driven with the flat side towards the instrument, and marked on the front with the number of the station. Intermediate stakes should be marked with the number of the last station + the additional distance in feet and tenths, as $10 + 67.4$. The stationing is not interrupted and taken up anew at each turning-point, but is continuous from beginning to end of the survey. At each turning-point a plug should be driven nearly flush with the ground, and a witness stake driven, in an inclined position, at a distance of about 15 inches from the plug, and at the side towards which the advance line deflects, and marked W and under it the station of the plug.

24. The Rear Chainman holds the rear end of the tape over the stake last set, but does not hold against the stake to loosen it. He calls "Chain" each time when the new stake is reached, being careful not to overstep the distance. He should stand beside the line (not on it) when measuring, and take pains not to obstruct the view of the transitman. He checks, and is responsible for the correct numbering of stakes, and for all distances less than 100 feet, as the head chainman always holds the end of the tape. The stations where the line crosses fences, roads, and streams should be set down in a small note-book, and reported to the transitman at the earliest convenient opportunity. The rear chainman is responsible for the tape.

25. The Back Flag holds the flag as a backsight at the point last occupied by the transit. The only signals necessary for him to understand from the transitman are "plumb the flag" and "all right." The flag should always be in position, and the transitman should not be delayed an instant. The back flag should be ready to come up the instant he receives the "all right" signal from the transitman. The duties are simple, but frequently are not well performed.

26. The Axeman cuts and clears through forest or brush. A good axeman should be able to keep the line well, so as to cut nothing unnecessary. In open country, he prepares the stakes ready for the stakeman or assists the locating engineer as *fore flag*.

27. The Leveler handles the level and generally keeps the notes, which may have the following form for the left-hand page. The right-hand page is for remarks and descriptions of turning-points and bench-marks. It is desirable that turning-

Station	+ S	H I	- S	Elevation
B.M.	4.67	104.67		100.00
0			5.7	99.0
1			6.9	97.8
2			3.4	101.3
T.P.	9.26	112.81	1.12	103.55
3			8.5	104.3

points should, where possible, be described, and that all bench-marks should be used as turning-points. Readings on turning-points should be recorded to hundredths or to thousandths of a foot, dependent upon the judgment of the Chief Engineer. Surface readings should be made to the nearest tenth, and elevations set down to nearest tenth only. A self-reading rod has advantages over a target rod for short sights. A target rod is possibly better for long sights and for turning-points. The "Philadelphia Rod" is both a target rod and a self-reading rod, and is thus well adapted for railroad use. Bench-marks should be taken at distances of from 1000 to 1500 feet, depending upon the country. All bench-marks, as soon as calculated, should be entered together on a special page near the end of the book. The leveler should test his level frequently to see that it is in adjustment. The leveler and rodman should together bring the notes to date every evening and plat the profile to correspond.

The profile of the preliminary line should show :—

- a. Surface line (in black).
- b. Grade line (in red).
- c. Grade elevations at each change in grade (in red).
- d. Rate of grade, per 100 (in red); rise +, fall —.
- e. Station and deflection at each angle in the line (in black).
- f. Notes of roads, ditches, streams, bridges, etc. (in black).

28. The Rodman carries the rod and holds it vertical upon the ground at each station and at such intermediate points as mark any important change of slope of the ground. The surface of streams and ponds should be taken when met, and at frequent intervals where possible, if they continue near the line.

Levels should also be taken of high-water marks wherever traces of these are visible. The rodman carries a small notebook in which he enters the rod readings at all turning-points. In country which is open, but not level, the transit party is liable to outrun the level party. In such cases greater speed will be secured by the use of two rodmen.

29. The Topographer is, or should be, one of the most valuable members of the party. In times past it has not always been found necessary to have a topographer, or if employed, his duty has been to sketch in the general features necessary to make an attractive map, and represent hills and buildings sufficiently well with reference to the line to show, in a general way, the reason for the location adopted. Sometimes the chief of the party has for this purpose taken the topography. At present the best practice favors the taking of accurate data by the topography party.

The topographer (with one or two assistants) should take the station and bearing (or angle) of every fence or street line crossed by the survey (unless taken by the transit party); also take measurements and bearings for platting all fences and buildings near enough to influence the position of the Location; also sketch, as well as may be, fences, buildings, and other topographical features of interest which are too remote to require exact location; and finally establish the position of contour lines, streams, and ponds, within limits such*that the Location may be properly determined in the contoured map.

The work of locating contours is usually accomplished by the use of hand level and tape (distances carefully paced may, in many cases, be sufficiently accurate). The level party has determined the elevations of the ground at each "station" set by the transit party. These elevations are given the topographers to serve as bench marks for use in locating contours. It is customary to fix on the ground the points where the contours cross the center line, where they cross lines at right angles to the center line at each station, and occasionally additional points; then to sketch the contours by eye between these points. Cross section sheets in blocks or in book form are used for this purpose. The usual contour interval is 5 feet.

A point on a contour is found as follows. The topographer stands at the station stake; a measurement is taken, by tape

or rod, of the distance from the topographer's feet to his eye; this added to the surface height at center stake (as obtained from the level party) gives the "height of eye" above datum. The difference between this "height of eye" and the elevation of the contour gives the proper rod reading for fixing a point on the contour, and the rod is carried vertically along the ground until this reading is obtained. The point thus found is then located. The topographer uses this point, already fixed, as a turning point, finds anew his "height of eye," and proceeds to find a point on the next contour. It is more convenient at times to carry on the process in reverse order; that is, to hold the rod on the ground at the station, and let the topographer place himself where his feet are on the contour. The "height of eye" must be the distance from topographer's feet to eye added to the elevation of contour. The rod reading at the station will be the difference between this "height of eye" and the elevation of the ground at the station.

The hand level is somewhat lacking in precision, but by making a fresh start at each station as a bench mark, cumulative errors are avoided, and fair results secured by careful work. Instead of a hand level, some topographers use a clinometer, and take and record side slopes as a basis for contour lines.

Topography can be taken rapidly and well by stadia survey or by plane table. This is seldom done, as many engineers are not sufficiently familiar with their use. Much more accurate results may be reached by plane table, and a party of three, well skilled in plane table work, will accomplish more than a party of three with hand level.

30. Some engineers advocate making a general topographical survey of the route by stadia, instead of the survey above described. In this case no staking out by "stations" would be done. All points occupied by the transit should be marked by plugs properly referenced, which can be used to aid in marking the location on the ground after it is determined on the contour map. This method has been used a number of times, and is claimed to give economical and satisfactory results; it is probable that it will have constantly increasing use in the future, and may prove the best method in a large share of cases.

CHAPTER III.

III. LOCATION SURVEY.

31. The Location Survey is the final fitting of the line to the ground. In Location, curves are used to connect the straight lines or "tangents," and the alignment is laid out complete, ready for construction.

The party is much the same as in the preliminary, and the duties substantially the same. More work devolves upon the transitman on account of the curves, and it is good practice to add a "note-keeper" to the party; he takes some of the transitman's work, and greater speed for the entire party is secured. More skill is useful in the head chainman in putting himself in position on curves. He can readily range himself on tangent. The form of notes will be shown later. The profile is the same, except that it shows, for alignment notes, the *P. C.* and *P. T.* of curves, and also the degree and central angle, and whether to the right or left.

It is well to connect frequently location stakes with preliminary stakes, when convenient, as a check on the work.

In making the location survey, two distinct methods are in use among engineers:—

32. First Method of Location.—Use preliminary survey and preliminary profile as guides in reading the country, and locate the line upon the ground. Experience will enable an engineer to get very satisfactory results in this way, in nearly all cases. The best engineers, in locating in this way, as a rule lay the tangents first, and connect the curves afterwards.

33. Second Method.—Use preliminary line, preliminary profile, and especially the contour lines on the preliminary map; make a paper location, and run this in on the ground. Some go so far as to give their locating engineer a complete set of notes to run by. This is going too far. It is sufficient to fix,

on the map, the location of tangents, and specify the degree of curve. The second method is much more desirable, but the first method has still some use. It is well accepted, among engineers, that no reversed curve should be used; 200 feet of tangent, at least, should intervene. Neither should any curve be very short, say less than 300 feet in length.

34. A most difficult matter is the laying of a long tangent, so that it shall be straight. Lack of perfect adjustment and construction of instrument will cause a "swing" in the tangent. The best way is to run for a distant foresight. Another way is to have the transit as well adjusted as possible, and even then change ends every time in reversing, so that errors shall not accumulate. It will be noticed that the preliminary is run in without curves because more economical in time; sometimes curves are run however, either because the line can be run closer to its proper position, or sometimes in order to allow of filing plans with the United States or separate States.

35. In Location, a single tangent often takes the place of a broken line in the preliminary, and it becomes important to determine the direction of the tangent with reference to some part of the broken line. This is readily done by finding the coördinates of any given point with reference to that part of the broken line assumed temporarily as a meridian. The course of each line is calculated, and the coördinates of any point thus found. It simplifies the calculation to use some part of the preliminary as an assumed meridian, rather than to use the actual bearings of the lines. The coördinates of two points on the proposed tangent allow the direction of the tangent to be determined with reference to any part of the preliminary. When the angles are small, an approximation sufficiently close will be secured, by assuming in all cases that the cosine of the angle is 1.000000 and that the sines are directly proportional to the angles themselves. In addition to this, take the distances at the nearest even foot, and the calculation becomes much simplified.

36. The located line, or "Location," as it is often called, is staked out ordinarily by center stakes which mark a succession of straight lines, connected by curves to which the straight lines are tangent. The straight lines are by general usage called "**Tangents.**"

CHAPTER IV.

SIMPLE CURVES.

37. The curves most generally in use are circular curves, although parabolic and other curves are sometimes used. Circular curves may be classed as **Simple**, **Compound**, **Reversed**, or **Spiral**.

A **Simple Curve** is a circular arc, extending from one tangent to the next. The point where the curve leaves the first tangent is called the "*P.C.*," meaning the point of curvature, and the point where the curve joins the second tangent is called the "*P.T.*," meaning the point of tangency. The *P.C.* and *P.T.* are often called the **Tangent Points**. If the tangents be produced, they will meet in a point of intersection called the "**Vertex**," *V*. The distance from the vertex to the *P.C.* or *P.T.* is called the "**Tangent Distance**," *T*. The distance from the vertex to the curve (measured towards the center) is called the **External Distance**, *E*. The line joining the middle of the **Chord**, *C*, with the middle of the curve subtended by this chord, is called the **Middle Ordinate**, *M*. The radius of the curve is called the **Radius**, *R*. The angle of deflection between the tangents is called the **Intersection Angle**, *I*. The angle at the center subtended by a chord of 100 feet is called the **Degree of Curve**, *D*. A chord of less than 100 feet is called a **sub-chord**, *c*; its central angle a **sub-angle**, *d*.

38. The measurements on a curve are made:

(a) from *P.C.* by a sub-chord (sometimes a full chord of 100 ft.) to the next full station, then

(b) by chords of 100 feet each between full stations, and finally,

(c) from the last station on the curve, by a sub-chord (sometimes a full chord of 100 ft.) to *P.T.* The total distance from *P.C.* to *P.T.* measured in this way, is the **Length of Curve**, *L*.

39. The **Degree of Curve** is defined as the angle subtended by a *chord* of 100 feet, rather than by an *arc* of 100 feet.

Either assumption requires approximate methods either in calculations or measurements, if the convenient and customary methods are followed. On the merits of the question, it is best to accept the definition given, and the practice in this country is largely in harmony with this definition, which is adopted by the American Railway Engineering Association.

Outside of the United States a curve is generally designated by its Radius, R . In the United States for railroad purposes, a curve is generally designated by its Degree, D .

40. Problem. *Given R .
Required D .*

$$R \sin \frac{1}{2} D = \frac{100}{2}$$

$$\sin \frac{1}{2} D = \frac{50}{R} \quad (1)$$

41. Problem. *Given D .
Required R .*

$$R = \frac{50}{\sin \frac{1}{2} D} \quad (2)$$

Example. *Given $D = 1^\circ$.*

$$\begin{array}{rcl} R_1 = \frac{50}{\sin \frac{1}{2} D} & 50 \log & 1.698970 \\ & 0^\circ 30' \log \sin & 7.940842 \\ R_1 = 5729.6 & \log & 3.758128 \end{array}$$

42. Problem. *Given R_1 (radius of 1° curve) or D_1 .
Required R_a (radius of any given curve of degree = D_a).*

$$\begin{array}{rcl} R_1 = \frac{50}{\sin \frac{1}{2} D_1} & R_a = & \frac{50}{\sin \frac{1}{2} D_a} \\ \frac{R_a}{R_1} = \frac{\sin \frac{1}{2} D_1}{\sin \frac{1}{2} D_a} & R_a = R_1 & \frac{\sin \frac{1}{2} D_1}{\sin \frac{1}{2} D_a} \end{array} \quad (3)$$

In the case of small angles, the angles are proportional to the sines (approximately),

$$R_a = R_1 \frac{\frac{1}{2} D_1}{\frac{1}{2} D_a}; \quad R_a = R_1 \frac{D_1}{D_a} \quad (3A)$$

But $R_1 = 5730$ to nearest foot,

$$R_a = \frac{5730}{D_a} \text{ (approx.)} \quad (4)$$

Example. $R_{10} = 573.7$ by (3), or by Allen's Table I.
 $= 573.0$ by (4) (approx.)

Some engineers use shorter chords for sharp curves, as 1° to 7° , 100 ft.; 8° to 15° , 50 ft.; 16° to 20° , 25 ft.

Values of R and D are readily convertible. For this purpose, use Table I., Allen [rather than formula (1) or (2)], when accurate results are required. In problems later, where either R or D is given, both will, in general, be assumed to be given. Approximate values can be found without tables by (4). The radius of a 1° curve = 5730 should be remembered. Precise results are, in general, necessary.

43. Problem. *Given I , also R or D .*

Required T .

$$AOB = NVB = I$$

$$AO = OB = R$$

$$AV = VB = T$$

$$T = R \tan \frac{1}{2} I \quad (5)$$

Example. *Given $D = 9$; $I = 60^\circ 48'$.*

Required T_9 .

$$\text{Table I., } R_9 \log = 2.804327$$

$$30^\circ 24' \log \tan = 9.768414$$

$$T_9 = 373.9 \log 2.572741$$

Note that $\log R_9$ is taken directly from Table I.

44. Approximate Method.

$$T_1 = R_1 \tan \frac{1}{2} I; T_a = R_a \tan \frac{1}{2} I$$

$$\frac{T_a}{T_1} = \frac{R_a}{R_1} = \frac{D_1}{D_a} = \frac{1}{D_a} \quad (\text{approx.})$$

$$T_a = \frac{T_1}{D_a} \quad (\text{approx.}) \quad (6)$$

Table III., Allen, gives values of T_1 for various values of I .

Table IV., Allen, gives a correction to be added *after* dividing by D_a .

Example. As before. Given $D = 9$; $I = 60^\circ 48'$.

Required T_9 .

$$\begin{array}{rcl} \text{Table III.,} & T_1 \ 60^\circ 48' & = \underline{3361.6(9)} \\ & T_9 & = \underline{373.51 \text{ (approx.)}} \end{array}$$

$$\begin{array}{rcl} \text{Table IV., correction, } 9^\circ \text{ and } 61^\circ & = & \underline{.38} \\ & T_9 & = \underline{373.9 \text{ (exact)}} \\ & & \text{the same as before} \end{array}$$

45. Problem. Given I , also R or D .

Required E .

$$\text{Using previous figure,} \quad VH = E = R \text{ exsec } \frac{1}{2} I \quad (7)$$

Table ~~XXXXII~~ shows definition of exsecant.

Table XIX. gives natural exsec.

Table XV. gives logarithmic exsec.

Approximate Method.

$$\text{By method used for (6),} \quad E_a = \frac{E_1}{D_a} \text{ (approx.)} \quad (8)$$

Table V. gives values for E_1 .

46. Problem. Given I , also R or D .

Required M .

$$FH = M = R \text{ vers } \frac{1}{2} I \quad (9)$$

Table ~~XXXXIII~~ shows definition of versine.

Table XIX. gives natural vers.

Table XV. gives logarithmic vers.

Table II. gives certain middle ordinates.

47. Problem. Given I , also R or D .

Required chord $AB = C$.

$$C = 2 R \sin \frac{1}{2} I \quad (10)$$

Table VIII. gives values for certain long chords.

48. Transposing, we find additional formulas, as follows :

$$\text{from (5)} \quad R = T \cot \frac{1}{2} I \quad (11)$$

$$(7) \quad R = \frac{E}{\operatorname{exsec} \frac{1}{2} I} \quad (12)$$

$$(9) \quad R = \frac{M}{\operatorname{vers} \frac{1}{2} I} \quad (13)$$

$$(10) \quad R = \frac{C}{2 \sin \frac{1}{2} I} \quad (14)$$

$$(4) \quad D_a = \frac{5730}{R_a} (\text{approx.}) \quad (15)$$

$$(6) \quad D_a = \frac{T_1}{T_a} (\text{approx.}) \quad (16)$$

$$(8) \quad D_a = \frac{E_1}{E_a} (\text{approx.}) \quad (17)$$

49. Problem. Given sub-angle d , also R or D .

Required sub-chord c .

$$c = 2 R \sin \frac{1}{2} d \quad (18)$$

Approximate Method.

$$100 = 2 R \sin \frac{1}{2} D$$

$$\frac{c}{100} = \frac{\sin \frac{1}{2} d}{\sin \frac{1}{2} D} = \frac{d}{D} (\text{approx.}) \quad (19)$$

The precise formula is seldom if ever used.

50. Problem. Given sub-chord c , also R or D .

Required sub-angle d .

$$d = \frac{cD}{100} \quad (20)$$

The value $\frac{d}{2}$ is more frequently needed and

$$\frac{d}{2} = \frac{c}{100} \frac{D}{2} \quad (21)$$

A modification of this formula is as follows :

$$\frac{d}{2} = \frac{cD}{200}$$

for $D = 1^\circ$

$$\frac{d}{2} = c \frac{60'}{200} = c \times 0.3'$$

for any value D_a

$$\frac{d}{2} = c \times 0.3' \times D_a \text{ (result in minutes)} \quad (22)$$

This gives a very simple and rapid method of finding the value of $\frac{d}{2}$ in minutes, and the formula should be remembered.

Example. Given sub-chord = 63.7. $D = 6^\circ 30'$.

Required sub-angle d (or $\frac{d}{2}$).

I. By (20) 63.7

$$\frac{6.5}{3185} = D$$

$$\frac{3822}{414.05}$$

$$4^\circ.14$$

$$\frac{60'}{60'}$$

$$d = 4^\circ 08'$$

$$\frac{d}{2} = 2^\circ 04'$$

II. By (21) 63.7

$$\frac{3.25}{3185} = \frac{D}{2}$$

$$1274$$

$$1911$$

$$207.025$$

$$2^\circ.07$$

$$\frac{60'}{60'}$$

$$\frac{d}{2} = 2^\circ 04'$$

III. By (22) 63.7

$$\frac{0.3}{19.11}$$

$$\frac{6.5}{9555} = D$$

$$11466$$

$$124.215 \text{ minutes}$$

$$\frac{d}{2} = 2^\circ 04'$$

Method III. is often preferable to I. or II.

51. Problem. *Given I and D .**Required L .*

The "Length of Curve" L is the distance around the curve, measured as stated in § 38, or $L = c_1 + 100 n + c_2$.

(a) When the *P.C.* is at a *full station*, D will be contained in I a certain number of times n , and there will remain a sub-angle d_2 subtended by its chord c_2 , and $L = 100 n + c_2$.

$$\frac{I}{D} = n + \frac{d_2}{D} = n + \frac{c_2}{100} \text{ (approx.)}$$

$$100 \frac{I}{D} = 100 n + c_2 = L \text{ (approx.)}$$

(b) When the *P.C.* is at a *sub-station* and *P.T.* at a *full station*, the same reasoning holds, and

$$L = 100 \frac{I}{D} \text{ (approx.)}$$

(c) When both *P.C.* and *P.T.* are at *sub-stations*, the same formula holds

$$L = 100 \frac{I}{D} \text{ (approx.)} \quad (23)$$

$$\text{Transposing,} \quad I = \frac{LD}{100} \text{ (approx.)} \quad (24)$$

$$D = \frac{100 I}{L} \quad (25)$$

These formulas (23) (24) (25), though approximate, are the formulas in common use.

Example. *Given 7° curve. $I = 39^\circ 37'$. Required L .*

$$I = 39^\circ 37'$$

$$D = 7 \overline{) 39.6167^\circ}$$

$$5.6595 + \quad L = 566.0$$

Example. *Given D and L . Required I .*

Given 8° curve.

$$\text{also, } P.T. = 93 + 70.1$$

$$P.C. = 86 + 49.3$$

$$L = 7 \quad 20.8$$

$$D = \quad 8'$$

$$57.664$$

$$\underline{\quad 60'}$$

$$39.84$$

$$I = 57^\circ 40'$$

52. Field-work of finding *P.C.* and *P.T.*

In running in the line, it is common practice to continue the stationing as far as *V*, to set a plug and mark a witness stake with the station of *V* as thus obtained. The angle *I* is then measured and "repeated" as a "check."

Having given *I* only, an infinite number of curves could be used. It is, therefore, necessary to assume additional data to determine what curve to use. It is common to proceed as follows:

- (a) Assume either (1) *D* directly.
- (2) *E* and calculate *D*.
- (3) *T* and calculate *D*.

It is often difficult to determine off-hand what degree of curve will best fit the ground. Frequently the value of E_a can be readily determined on the ground. The determination of *D* from E_a is readily made, using the approximate formula $D_a = \frac{E_1}{E_a}$. Similarly, we may be limited to a given (or ascertainable) value of T_a , and from this readily find $D_a = \frac{T_1}{T_a}$.

This process is to determine what value of D_a will fit the ground, and it is convenient, generally, to use the degree or half degree nearest to that calculated. (Some engineers use $1^\circ 40' = 100'$ and $3^\circ 20' = 200'$, etc., rather than $1^\circ 30'$ or $3^\circ 30'$, etc.)

When the D_a is thus determined, all computations must be strictly based on this value of D_a .

- (b) From the data finally adopted *T* is calculated anew.
- (c) The instrument still being at *V*, the *P.T.* is set by laying off *T*. It is economical to set *P.T.* before *P.C.*
- (d) The station of *P.C.* is calculated and *P.C.* set from the nearest station stake (or by measuring back from *V*).
- (e) The length of curve *L* is calculated, and station of *P.T.* thus determined (not by adding *T* to station of *V*).

Whether *D*, *E*, or *T* shall be assumed depends upon the special requirements in each case. Curves are often run out from *P.C.* without finding or using *V*, but the best engineering usage seems to be in favor of setting *V*, whenever this is at all practicable, and from this finding the *P.C.* and *P.T.*

53. Example. *Given a line, as shown in sketch.*

Required a Simple Curve to connect the Tangents.

P.T. is to be at least 300 ft. from end of line.

Use smallest degree or half degree consistent with this.

Find degree of curve and stations of P.C. and P.T.

530

300

Table III.	$22^\circ 14'$	$T_1 = 1125.8 \left(\frac{230}{92} = T \text{ (approx.)} \right)$	use 5° curve
		$\frac{205}{225.16}$	

$$T_1 = \frac{1125.8(5^\circ)}{225.16}$$

$$V = 46 + 72.7$$

Table IV. corr.	$.07$	$I = 22^\circ 14'$	$T = \frac{2 + 25.2}{225.2}$
		$= 22^\circ.2333(5^\circ)$	$P.C. = 44 + 47.5$
		$L = 444.7$	$L = \frac{4 + 44.7}{P.T. = 48 + 92.2}$

It will be noticed that the station of the *P.T.* is found by adding *L* to the stations of the *P.C.* (not by adding *T* to the station of *V*).

Similarly *Given E = 17 ft.*

Table V.	$22^\circ 14'$	$E_1 = 109.6 \left(\frac{17}{102} = E \right)$	use $6^\circ 30'$ curve
		$\frac{76}{173.20}$	

$$T_1 = \frac{1125.8(6.5)}{173.20}$$

$$I = 22^\circ.2333(6.5) \quad V = 46 + 72.7$$

$$\text{corr.} \quad .09 \quad L = \frac{342.1}{T = \frac{1 + 73.3}{P.C. = 44 + 99.4}}$$

$$T = 173.3$$

$$L = \frac{3 + 42.1}{P.T. = 48 + 41.5}$$

Under the conditions prescribed above, when *T* is given, the degree, or half degree, next larger must be used, in order to secure *at least* the required distance (to end of line above).

When *E* is given, the nearest half degree is generally used.

54. Method of Deflection Angles.

If at any point on an existing curve a tangent to the curve be taken, the angles from the tangent to any given points on the curve may be measured, and the angles thus found may be called **Total Deflections** to those points (as NA_1 , NA_2 , NA_3).

In laying out successive points upon a straight line (as on a "Tangent"), each point is generally fixed by

(a) measurement from the preceding point and

(b) line;

the line on a tangent will be the same for all points.

Similarly, in laying out a curve, successive points may be fixed by

(a) measurement from the preceding point and

(b) line;

the line in this case, for the curve, will be that found by using the *total deflection* calculated for each point. In the figure preceding, the chord distance $A1$ and the total deflection NA_1 fix point 1; the chord distance $1-2$ and total deflection NA_2 fix point 2; and $2-3$ and NA_3 fix 3. A curve can be conveniently laid out by this method if the proper total deflections can be readily computed.

55. The method of "Deflection Angles" is well adapted to surveying an existing curve; it is also well adapted to laying out any curve, provided only that it is possible to readily determine

(a) the "Total Deflection Angles" and

(b) the chord lengths that go with them.

In the case of "*Simple Curves*," the "total deflections" can be readily computed, and the method of "deflection angles" is therefore well adapted to laying them out.

In the case of "spiral" or "transition" curves, tables have commonly been computed, so that the angles and chords are taken from the tables. Any curve which has been surveyed by this method can be restaked on the ground by using the deflection angles and chords measured and recorded.

56. Problem. To find the *Total Deflections* for a Simple Curve having given the *Degree*.

I. *When the curve begins and ends at even stations.*

The distance from station to station is 100 feet. The deflection angles are required.

An acute angle between a tangent and a chord is equal to one half the central angle subtended by that chord

$$A1 = 100$$

$$VA1 = \frac{1}{2} D$$

The acute angle between two chords having their vertices in the circumference is equal to one half the arc included between those chords.

$$1 - 2 = 100 \text{ and } 1A2 = \frac{1}{2} D \text{ Similarly,}$$

$$2 - 3 = 100 \text{ and } 2A3 = \frac{1}{2} D$$

$$3 - B = 100 \text{ and } 3AB = \frac{1}{2} D$$

This angle $\frac{1}{2} D$ is called by Henck and Searles the **Deflection Angle**, and will be so called here. Shunk and Trautwine call it the "*Tangential Angle*." The weight of engineering opinion appears to be largely in favor of the "*Deflection Angle*."

The "*Total Deflections*" will be as follows:

$$VA1 = \frac{1}{2} D$$

$$VA2 = VA1 + \frac{1}{2} D$$

$$VA3 = VA2 + \frac{1}{2} D$$

VAB will be found by successive increments of $\frac{1}{2} D$.

VAB = VBA = $\frac{1}{2} I$. This furnishes a "check" on the computation.

II. *When the curve begins and ends with a sub-chord.*

$$VA1 = \frac{1}{2} d$$

$$VA2 = VA1 + \frac{1}{2} D$$

$$VA3 = VA2 + \frac{1}{2} D$$

VAB is found by adding $\frac{1}{2} d_2$ to previous "total deflection."

VAB = VBA = $\frac{1}{2} I$. This furnishes "check." The total deflections should be calculated by successive increments; the final "check" upon $\frac{1}{2} I$ then checks all the intermediate total deflections. The example on next page will illustrate this.

57. Field-work of laying out a simple curve having given the position and station of *P.C.* and *P.T.*

- (a) Set the transit at *P.C.* (A).
- (b) Set the vernier at 0.
- (c) Set cross hairs on V (or on N and reverse).
- (d) Set off $\frac{1}{2} d_1$ (sometimes $\frac{1}{2} D$) for point 1.
- (e) Measure distance c_1 (sometimes 100) and fix 1.
- (f) Set off total deflection for point 2.
- (g) Measure distance 1-2 = 100 and fix 2, etc.
- (h) When total deflection to B is figured, see that it = $\frac{1}{2} I$, thus "checking" calculations.
- (i) See that the proper calculated distance c_2 and the total deflection to B agree with the actual measurements on the ground, checking the field-work.
- (k) Move transit to *P.T.* (B).
- (l) Turn vernier back to 0, and beyond 0 to $\frac{1}{2} I$.
- (m) Sight on A.
- (n) Turn vernier to 0.
- (o) Sight towards V (or reverse and sight towards P), and see that the line checks on V or P.

It should be observed that three "checks" on the work are obtained.

1. The calculation of the total deflections is checked if total deflection to B = $\frac{1}{2} I$.
2. The chaining is checked if the final sub-chord measured on the ground = calculated distance.
3. The transit work is checked if the total deflection to B brings the line accurately on B.

The check in 1 is effective only when the total deflection for each point is found by adding the proper angle to that for the preceding point.

The check in 3 assures the general accuracy of the transit work, but does not prevent an error in laying off the total deflection at an intermediate point on the curve.

58. Example. *Given Notes of Curve*

$$P.T. \ 13 + 45.0$$

$$P.C. \ 10 + 74.0$$

6° curve **L***Required the "total deflections"*

$$\text{to sta. 11 } c_1 = 26$$

$$\begin{array}{r} .3 \\ \hline 7.8 \end{array}$$

$$\frac{d_1}{2} = \frac{6^\circ}{46.8} = 0^\circ 47' \text{ to 11}$$

$$c_2 = 45 \quad \frac{3^\circ}{3^\circ 47'} \text{ to 12}$$

$$\begin{array}{r} .3 \\ \hline 13.5 \end{array} \quad \frac{3^\circ}{6^\circ 47'} \text{ to 13}$$

$$\frac{d_2}{2} = \frac{6^\circ}{81.0} = 1^\circ 21' \quad \frac{8^\circ 08'}{8^\circ 08'} \text{ to 13 + 45}$$

$$13 + 45.0$$

$$10 + 74.0$$

$$\frac{2}{2} \quad 71.0 = L$$

$$\begin{array}{r} 6^\circ \\ \hline 16.26 \end{array}$$

$$16^\circ$$

$$\begin{array}{r} 60' \\ \hline 15.6' \end{array}$$

$$\begin{array}{r} 16' \\ \hline 16^\circ 16' = I \end{array}$$

$$8^\circ 08' = \frac{1}{2} I \text{ "check"}$$

59. Caution.

If a curve of nearly $180^\circ = I$ is to be laid out from A, it is evident that it would be difficult or impossible to set the last point accurately, as the "intersection" would be bad. It is undesirable to use a total deflection greater than 30° .

It may be impossible to see the entire curve from the *P.C.* at A.

It will, therefore, frequently happen that from one cause or another the entire curve cannot be laid out from the *P.C.*, and it will be necessary to use a modification of the method described above.

60. Field-work. *When the entire curve cannot be laid out from the P.C.*

First Method.

- (a) Lay out curve as far as C, as before.
- (b) Set transit point at some convenient point, as C (even station preferably) and move transit to C.
- (c) Turn vernier back to 0° , and beyond 0° by the value of angle VAC.
- (d) Sight on A.
- (e) Turn vernier to 0° . See that transit line is on auxiliary tangent NCM (VAC = NCA being measured by $\frac{1}{2}$ arc AC).
- (f) Set off new deflection angle ($\frac{1}{2}d$ or $\frac{1}{2}D$).
- (g) Set point 4, and proceed as in ordinary cases.

Second Method.

- (a) Set point C as before, and move transit to C.
- (b) Set vernier at 0° and sight on A.
- (c) Set off the proper "total deflection" for the point 4 = VA 4 NCA + MC 4 = VA 4, each measured by $\frac{1}{2}$ arc AC 4.
- (d) Reverse transit and set point 4.
- (e) Set off and use the proper "total deflections" for the remaining points.

The second method is in some respects more simple, as the notes and calculations, and also setting off angles, are the same as if no additional setting were made. By the first method the deflection angles to be laid off will, in general, be even minutes, often degrees or half degrees, and are thus easier to lay off. It is a matter of personal choice which of the two methods shall be used. It will be disastrous to attempt an incorrect combination of parts of the two methods.

61. Field-work. When the transit is in the curve, and the *P.C.* is not visible.

(a) Compute deflection angles, *P.C.* to *P.T.*; check on $\frac{I}{2}$ (same as in § 56).

(b) Set vernier at deflection angle computed for point (*e.g.* 2) used as backsight.

(c) Set line of sight on backsight (2) and clamp.

If vernier be made to read 0° , the line of sight will then be in direction of *P.C.* (since angle $\angle A2 = 24A$).

(d) Set off deflection angles computed for 5, etc.

62. Field-work. When entire curve is visible from *P.T.*

(a) Compute deflection angles, *P.C.* to *P.T.*; check on $\frac{I}{2}$ (same as in § 56).

(b) Set transit at *P.T.* with vernier at 0° and sight on *P.C.*

(c) Set off computed angles for 1, 2, 3, 4, 5.

(d) Set off $\frac{I}{2}$ and sight at V for check on transit work.

This method is preferable to that given in § 57. It saves the transit setting at *P.C.* The long sights are taken first, before errors of chaining have accumulated and before the transit has settled or warped in the sunlight. The last point on curve is set at a small angle with the tangent, so that the intersection is good and any accumulated errors of chaining will not much affect the line. The method is already accepted practice.

63. Metric Curves.

In Railroad Location under the "**Metric System**" a chain of 100 meters is too long, and a chain of 10 meters is too short. Some engineers have used the 30-meter chain, some the 25-meter chain, but lately the 20-meter chain has been generally adopted as the most satisfactory. Under this system a "*Station*" is 10 meters. Ordinarily, every second station only is set, and these are marked Sta. 0, Sta. 2, Sta. 4, etc. On curves, *chords of 20 meters* are used. Usage among engineers varies as to what is meant by the *Degree of Curve* under the metric system. There are two distinct systems used, as shown below.

I. The *Degree of Curve* is the *angle at the center* subtended by a chord of 1 chain of 20 meters.

II. The *Degree of Curve* is the *deflection angle* for a chord of 1 chain of 20 meters (or one half the angle at the center).

II. Or, very closely, the *Degree of Curve* is the *angle at the center* subtended by a chord of 10 meters (equal to 1 station length).

For several reasons the latter system is favored here. Tables upon this basis have been calculated, giving certain data for metric curves. Such tables are to be found in Allen's Field and Office Tables.

In many countries where the metric system is used, it is not customary to use the *Degree of Curve*, as indicated here. In Mexico, where the metric system is adopted as the only legal standard, very many of the railroads have been built by companies incorporated in this country, and under the direction of engineers trained here. The usage indicated above has been the result of these conditions. If the metric system shall in the future become the only legal system in the United States, as now seems possible, one of the systems outlined above will probably prevail.

In foreign countries where the *Degree of Curve* is not used, it is customary, as previously stated, to designate the curve by its radius R , and to use even figures, as a radius of 1000 feet, or 2000 feet, or 1000 meters, or 2000 meters. As the radius is seldom measured on the ground, the only convenience in even figures is in platting, while there is a constantly recurring inconvenience in laying off the angles.

64. Form of Transit Book (left-hand page).

(Date)				
(Names of Party)				
Station	Points	Descrip. of Curve	Total Deflect.	Observed Course
114				
113				
112				
111				
110				
109	⊙+ 90.0 <i>P. T.</i>		11° 15'	N 46° 00' E
108		$R = 1146.3$	9° 00'	
107		$L = 450.0$	6° 30'	
106	⊙+ 68.0 <i>V</i>	$T = 228.0$	4° 00'	
105		$I = 22° 30'$	1° 30'	
104	⊙+ 40.0 <i>P. C.</i>	5° Right		
103				
102				
101				
100				
99				N 23° 15' E
98				

V is not a point on the curve. Nevertheless, it is customary to record the station found by chaining along the tangent.

The right-hand page is used for survey notes of crossings of fences and various similar data. It seems unnecessary to show a sample here.

3060

65. Circular Arcs. For general railroad work, the Length of Curve is the distance measured by a series of chords as defined in § 38 and § 51. For certain purposes, largely outside of railroad work, the actual length of arc is required. Where the line of a street is curved, the length of the side line of street, the property line of a lot or estate, may be required. Furthermore, both in railroad and street railway work, actual lengths of rails are sometimes required.

Problem. *Given the Central Angle I and Radius R .
Required the Length of Arc.*

Table XX., p. 205, Allen, gives lengths of circular arcs for radius = 1. The values for degrees, minutes and seconds are added; the sum multiplied by R is the required length of arc.

Example. *Given $I = 18^\circ 43' 29''$; $R = 600$.*

Required Length of Arc and Deflection Angles.

	18°	0.3141593
	$43'$	0.0125082
	$29''$	0.0001406
		0.3268081
	R	600
Length of Arc = 196.08		196.08486

Where a series of points are to be set on the circular arc, there are several methods available, each of which has some desirable features.

I. (a) *Divide the entire arc length into an equal number of parts.*

(b) *Compute the deflection angles to correspond.*

(c) *Compute the chord lengths to correspond.*

In the example above, if 4 intermediate points are to be set on the arc, the length of arc will be divided by 5; the final deflection angle will be $\frac{1}{2} I$; and the first deflection angle, i_1 , will be $\frac{1}{2} I \div 5$.

$$\begin{array}{r} 5 \overline{) 196.08} = \text{Length of Arc} \\ 39.216 \end{array}$$

$$\begin{array}{r} I = 18^\circ 43' 29'' \\ \frac{1}{2} I = 9^\circ 21' 44'' \div 5 \\ i_1 = 1^\circ 52' 21'' \end{array}$$

The deflection angles will be (to nearest $\frac{1}{2}$ minute) $1^{\circ} 52' 30''$; $3^{\circ} 44' 30''$; $5^{\circ} 37'$; $7^{\circ} 29' 30''$; $9^{\circ} 21' 30''$. For chaining, the length of chord is necessary and may be computed by formula (10). Where the radius is large, natural sines may not give satisfactory results, and it may be necessary to use the auxiliary tables of log. sines.

A simpler method is to use Allen's Table XX., A, which gives for $R = 1$ the difference between arc and chord for various central angles.

For central angle $3^{\circ} 45'$	diff. =	0.000012	Table XX., A.
	$R =$	$\frac{600}{0.007}$	
	Arc =	39.216	
	Chord =	39.209	

The *P.T.* of the circular arc should be set with the required precision by long chord from *P.C.* and the several chords measured with a degree of precision sufficient to secure a "check" against material error.

II. (a) Use a series of equal chords of convenient length, followed by a sub-chord to the *P.T.*

(b) Compute deflection angles to correspond.

(c) Compute arc lengths to correspond.

(d) Compute sub-chord length.

Example. Given as before $I = 18^{\circ} 43' 29''$; $R = 600$.

Take chord length of 40 ft.

Let i_1 = deflection angle for chord of 40 ft.

$$\text{Then } \sin i_1 = \frac{20}{600} \qquad i_1 = 1^{\circ} 54' 37''$$

and corresponding central angle $d_1 = 3^{\circ} 49' 14''$.

For central angle $3^{\circ} 49'$ diff. = 0.000012 Table XX., A.

	$R =$	$\frac{600}{0.007}$
	arc =	40.007
4 lengths of arc =		160.028
entire arc	=	196.085 from p. 37
sub-arc	=	36.057 for $R = 600$
$36.057 \div 600 =$		$0.060095 = \text{sub-arc for } R = 1$

From p. 38,	0.0600950 = sub-arc for $R = 1$
Table XX., 3°	$\frac{0.0523599}{0.0077351}$
$26'$	$\frac{0.0075631}{0.0001720}$
$85''$	0.0001697

For central angle $3^\circ 27'$ diff. =	0.000009
$R =$	$\frac{600}{0.005}$
sub-arc =	$\frac{36.057}{36.052}$
sub-chord =	

III. (a) Use uniform deflection angles to some convenient even minute, except for final sub-chord.

(b) Compute chord lengths to correspond.

(c) Compute arc lengths to correspond.

Example. Given as before. $I = 18^\circ 43' 29''$ $R = 600$

For 5 equal arcs $i_1 = 1^\circ 52' 21''$

Assume $i_1 = 2^\circ 00'$; then $2 i_1 = 4^\circ 00' = \text{central angle.}$

For central angle 4° diff. = 0.000014 Table XX., A
 $R = \frac{600}{0.008}$

Chord length for $4^\circ = 2 \times 600 \times \sin 2^\circ = 41.880$
 arc length = 41.888

$I = 18^\circ 43' 29''$
 $4 \times \text{central angle } 4^\circ = 16^\circ$
 final sub-angle $d_2 = 2^\circ 43' 29''$
 For central angle $2^\circ 43'$ diff. = 0.000004 Table XX., A.
 $R = \frac{600}{0.002}$

For central angle $2^\circ 43' 29''$ arc = 0.0475554 Table XX.
 $R = \frac{600}{28.53324}$
 diff. = $\frac{0.002}{28.531}$
 final sub-chord =

66. Problem. *Given D and stations of $P.C.$ and $P.T.$
Required to lay out the curve by the method
of Offsets from the Tangent.*

Let AG' be tangent to curve AG

Find $E'/AE = \frac{1}{2} d = \alpha_1$

When $AE=100$, then $\frac{1}{2}d$ becomes $\frac{1}{2}D$.

$$F''EF = d + \frac{1}{2} D = \alpha_2$$

$$G''FG = d + D + \frac{1}{2}D = \alpha_3, \text{ etc.}$$

Draw EH tangent at E.

Also FN tangent at F.

The α for each chord is found by taking the *central* angle to the *beginning* of the chord plus the *deflection* angle for the chord.

$$\alpha_2 = F'EH + HEF$$

$$= d + \frac{1}{2} D$$

$$\alpha_3 = G''FN + NFG$$

$$= d + D + \frac{1}{2} D$$

$$AE' = c_1 \cos \alpha_1$$

$$EE' = c_1 \sin \alpha_1$$

$$EF'' = 100 \cos \alpha_2$$

$$FF'' = 100 \sin \alpha_2$$

$$FG'' = 100 \cos \alpha_3$$

$$GG'' = 100 \sin \alpha_3$$

$$FF' = EE' + FF''$$

$$GG' = FF' + GG'', \text{ etc.}$$

For the computations indicated above, always use natural sines and cosines.

For a check,

$$AG' = R \sin AOG$$

GG' = R vers AOG

where O is at center of curve.

For the computations immediately above, use log sines and versines.

These "check" computations involve the radius (or degree) and the central angle; the previous computations involve the use of c also; since the formula

$$d = \frac{cD}{100} \quad (20)$$

is an approximate formula, perfect precision in the "check" cannot be expected.

If a "check" perfectly precise is required, use formula (18) $c = 2 R \sin \frac{1}{2} d$ instead of formula (20) and carry all intermediate work to the necessary degree of precision.

This method of Offsets from the Tangent is a precise method, and allows of any desired degree of precision in field-work.

Another method of finding the angles $\alpha_1, \alpha_2, \alpha_3$, etc., is by drawing perpendiculars to the chords at K, L, and M.

$$\begin{aligned} \text{Then} \quad \alpha_1 &= \frac{1}{2} d \\ \alpha_2 &= \alpha_1 + \frac{1}{2} d + \frac{1}{2} D \\ &= d + \frac{1}{2} D \text{ (as before)} \\ \alpha_3 &= \alpha_2 + D \text{ etc.} \end{aligned}$$

Each α being found by adding an increment to the previous value of α .

$$\text{Also} \quad \alpha_3 = \text{AOG} - \frac{1}{2} D$$

which gives a "check" on all values of α computed.

If AE, EF, FG, are parts of a compound curve, the same general methods are applicable, except that the checks of $R \sin \text{AOG}$ and $R \text{ vers AOG}$ are not then available.

67. Field-work.

- (a) Calculate AE', E'F', F'G'; also EE', FF', GG'
- (b) Set E', F', G', by measurements AE', E'F', F'G'.
- (c) Set E by distance AE (c_i) and EE'.
- (d) Set F " " EF (100) and FF'.
- (e) Set G " " FG (100) and GG'.

68. Problem. *Given D and the stations of $P.C.$ and $P.T.$
Required to lay out the curve by the method
of Deflection Distances.*

When the curve begins and ends at even stations.

In the curve AB , let

AN be a tangent

AE any chord $= c$

EE' perp. to $AE' = a =$

"tangent deflection"

$FF' = BB' =$ the

"chord deflection"

$AO = EO = R$

Draw OM perpendicular to AE .

Then $EE' : AE = ME : EO$

$$a : c = \frac{c}{2} : R \quad \text{or } a = \frac{c^2}{2R} \quad (26)$$

$$FF' = 2a; AF' = AE \text{ produced}$$

$$\text{When } AE \text{ is a full station of 100 feet, } a_{100} = \frac{100^2}{2R} \quad (26 A)$$

Field-work.

The $P.C.$ and $P.T.$ are assumed to have been set.

(a) Calculate a_{100} .

(b) Set point E distant 100 ft. from A and distant a_{100} from AE' ($AE' < 100$ ft.; $AE'E = 90^\circ$).

(c) Produce AE to F' ($EF' = 100$ ft.), and find F distant $2a_{100}$ from F' ($EF = 100$ ft.).

(d) Proceed similarly until B is reached ($P.T.$).

(e) At station preceding B ($P.T.$) lay off $FG' = a_{100}$ ($FG'B = 90^\circ$).

(f) $G'B$ is tangent to the curve at B ($P.T.$).

69. Problem. *Given the degrees of two curves having the same P.C.*

Required the offset between the two curves at the end of a given chord c .

Let D_l and R_l be the D and R of flatter curve, D_s and R_s be the D and R of sharper curve.

$$\text{For } 1^\circ \text{ curve } a_1 = \frac{c^2}{2 R_1}; \quad a_l = \frac{c^2}{2 R_l}; \quad a_s = \frac{c^2}{2 R_s}$$

$$\frac{a_l}{a_1} = \frac{\frac{1}{R_l}}{\frac{1}{R_1}} = \frac{D_l}{D_1} \quad (\text{approx.}) \quad \text{from (3 A)}$$

$$a_l = a_1 D_l \text{ and } a_s = a_1 D_s. \quad (26 B)$$

Let a_{s-l} = offset between curves = $a_s - a_l$

$$\begin{aligned} a_{s-l} &= a_1 D_s - a_1 D_l \\ &= a_1 (D_s - D_l) \quad (\text{approx.}) \end{aligned} \quad (27)$$

For 1° curve and $c = 100$ $a_1 = 0.873 \text{ ft.} = \frac{7}{8} \text{ ft.}$ (nearly).

$$a_{s-l} = \frac{7}{8} (D_s - D_l) \text{ ft.} \quad (\text{approx.}) \quad (27 A)$$

70. Problem. *Given the offset to any curve for 1 chord of 100 ft.*

Required the offset for any number of chords n , each 100 ft.

$$a = \frac{c^2}{2 R} \quad \text{and} \quad a_{100} = \frac{100^2}{2 R} \quad \text{from (26 A)}$$

$$\text{for } c = 200 \quad a_{200} = \frac{200^2}{2 R}; \quad \text{for } c = n \text{ } 100 \quad a_n = \frac{n^2 100^2}{2 R}$$

but n chords of 100 ft. each = chord n 100 (nearly) and

$$a_n = \frac{n^2 100^2}{2 R} \quad \text{or} \quad a_n = n^2 a_{100} \quad (\text{approx.}) \quad (28)$$

This approximation may prove too rough for most field-work unless n is very small. It may be of value in plotting. It should seldom be used for other purposes.

Similarly from (27 A) $a_n = \frac{7}{8} (D_s - D_l) n^2$ (roughly).

71. Problem. Given D and the stations of $P.C.$ and $P.$
 Required to lay out the Curve by Deflection
 Distances.

When the curve begins and ends with a sub-chord.

by (26) $a_i = \frac{c_i^2}{2R}$; $a_f = \frac{c_f^2}{2R}$; $a_{100} = \frac{100^2}{2R}$

$$\left. \begin{aligned} a_i : a_{100} &= c_i^2 : 100^2 & a_i &= a_{100} \frac{c_i^2}{100^2} \\ a_f : a_{100} &= c_f^2 : 100^2 & a_f &= a_{100} \frac{c_f^2}{100^2} \end{aligned} \right\} \quad (29)$$

In general it is better to use (29) than $a_i = \frac{c_i^2}{2R}$.

72. Example. Given $P.T.$ 20 + 42 6° curve R
 $P.C.$ 16 + 25

Required all data necessary to lay out curve by "Deflection Distances."

Calculate without Tables. Result to $\frac{1}{100}$ foot.

Radius 1° curve = $\frac{5730}{6}$
 6° 955

$a_{100} = \frac{100^2}{2 \times 955} = 5.24$

$2 a_{100} = 10.47$

$a_{75} = 0.75^2 \times 5.24 = 2.95$

$a_{42} = 0.42^2 \times 5.24 = 0.92$

Table II. gives $a_{100} = 5.234$ (precise value)

$$\begin{array}{r} 1910) 10000 (5.235 + \\ \underline{955} \\ 450 \\ \underline{382} \\ 680 \\ \underline{573} \\ 1070 \\ \underline{955} \end{array}$$

The distance AE' is slightly shorter than AE . It is generally sufficient to take the point E' by inspection simply. If desired for this or any other purpose, a simple approximate solution of right triangles is as follows:

73. Problem. *Given the hypotenuse (or base) and altitude. Required the difference between base and hypotenuse, or in the figure, $c - a$.*

$$\begin{aligned} c^2 - a^2 &= h^2 \\ (c - a)(c + a) &= h^2 \\ c - a &= \frac{h^2}{c + a} = \frac{h^2}{2c} \text{ (approx.)} = \frac{h^2}{2a} \text{ (approx.)} \quad (30) \end{aligned}$$

Wherever h is small in comparison with a or c , the approximation is good for ordinary purposes.

Example.	$c = 100$	$c - a = \frac{100}{200} = 0.50$
	$h = 10$	$a = 99.50$

The precise formula gives 99.499.

74. Field-work for § 71.

(a) Calculate a_{100} , a_i , a_f . Remember that tangent deflections are as the *squares* of the chords.

a_{100} is found in Table II., Allen, as "tangent offset."

(b) Find the point E, distant a_i from AE' and distant c_i from A. ($AE'E = 90^\circ$.)

(c) Erect auxiliary tangent at E (lay off $AA' = a_i$).

(d) From auxiliary tangent $A'E$ produced, find point F.

$$(FF' = a_{100}; EF = 100; EF'F = 90^\circ).$$

(e) From chord EF produced, find point G.

$$(GG' = 2 a_{100}; FG' = FG = 100).$$

(f) Similarly, for each full station, use $2 a_{100}$, etc.

(g) At last even station on curve, H, erect an auxiliary tangent (lay off $GG'' = a_{100}$; $GG''H = 90^\circ$).

(h) From $G''H$ produced, find B ($B'B = a_f$, etc.).

(i) Find tangent at B ($HH'' = a_f$; $HH''B = 90^\circ$).

The values of a_{100} , a_i , a_f , should be calculated to the nearest $\frac{1}{100}$ foot.

75. Caution. The tangent deflections vary as the *squares* of the chords, not directly as the chords.

Curves may be laid out by this method without a transit by the use of plumb line or "flag" for sighting in points, and with *fair* degree of accuracy.

For calculating a_{100} , a_i , a_f , it is sufficient in most cases to use the approx. value $R_a = \frac{5730}{D_a}$. A curve may be thus laid out without the use of transit or tables.

For many approximate purposes it is well and useful to remember that the "chord deflection" for 1° curve is 1.75 ft. nearly, and for other degrees in direct proportion. A head chainman may thus put himself *nearly* in line without the aid of the transitman.

The method of "Deflection Distances" is not well adapted for common use, but will often be of value in emergencies.

76. Problem. Given D and stations of $P.C.$ and $P.T.$

Required to lay out the curve by "*Deflection Distances*" when the *first sub-chord is small*.

Caution. It will not be satisfactory in this case to produce the curve from this short chord. The method to be used can best be shown by example.

Let $PC = 41 + 90$.

Field-work.

Method 1.

(a) Set sta. 42 using $c = 10$ and $a_{10} = a_{100} \frac{10^2}{100^2}$.

(b) Set sta. 43 (100 ft. from 42) offsetting a_{110} from tangent.

(c) Set sta. 44 by chord produced and $2 a_{100}$ offset.

Method 2.

(a) Set a point on curve produced backwards, using

$$c = 90 \text{ and } a_{90} = a_{100} \frac{90^2}{100^2}.$$

(b) Set sta. 42, using $c = 10$ and a_{10} as above.

(c) Set sta. 43 by chord produced and $2 a_{100}$ offset.

A slight approximation is involved in each of these methods. Method 1 involves less labor.

77. Ordinates.

Problem. *Given D and two points on a curve.*

Required the Middle Ordinate from the chord joining the two points.

By (9),

$$M = R \text{ vers } \frac{1}{2} I$$

for 100 ft. chord

$$M = R \text{ vers } \frac{1}{2} D$$

between points 2 station lengths apart

$$M = R \text{ vers } D.$$

Let A = angle at center between any two points.

$$M = R \text{ vers } \frac{1}{2} A.$$

78. Problem. *Given R and c .*

Required M .

$$OL = \sqrt{R^2 - \left(\frac{c}{2}\right)^2}$$

$$HL = M = R - \sqrt{R^2 - \left(\frac{c}{2}\right)^2} \quad (31)$$

$$M = R - \sqrt{\left(R - \frac{c}{2}\right)\left(R + \frac{c}{2}\right)} \quad (32)$$

Table XXI., Allen, gives squares and square roots for certain numbers. If the numbers to be squared can be found in this table, use (31). Otherwise use logarithms and (32).

79. Problem. *Given R and C .*

Required the Ordinate at any given point Q .

Measure $LQ = q$.

Then $KN = \sqrt{R^2 - q^2}$

$$LO = \sqrt{R^2 - \left(\frac{c}{2}\right)^2}$$

$$KQ = KN - LO = \sqrt{(R + q)(R - q)} - \sqrt{\left(R + \frac{c}{2}\right)\left(R - \frac{c}{2}\right)} \quad (33)$$

80. When $C = 100$ ft. or less, an approximate formula will generally suffice.

Problem. Given R and c .

Required M (approx.)

$$HL : AH = \frac{AH}{2} : R$$

$$M = \frac{AH^2}{2R}$$

Where AB is small compared with R ,

$$AH = \frac{c}{2} \text{ (approx.)}$$

$$M = \frac{c^2}{8R} \text{ (approx.)} \quad (34)$$

81. Example. Given $C = 100$, $D = 9^\circ$.

Required M .

$$R_9 = \frac{5730}{9} = \frac{636.7}{8}$$

$$\frac{5093.6}{10000} (1.963 = M)$$

50936
490640
458424
322160
305616
16544

Precise value

$$M = 1.965$$

Table XXVII., Allen, gives middle ordinates for curving rails of certain lengths.

82. Problem. Given R and c .

Required Ordinate at any given point Q

Approximate Method.

I. Measure $LQ = q$

$$M = HL = \frac{\left(\frac{c}{2}\right)^2}{2R} \text{ (approx.)}$$

$$KK' = \frac{HK^2}{2R}$$

$$KK' : M = HK^2 : \left(\frac{c}{2}\right)^2$$

$$\text{Since } HK = q \text{ (approx.)} \quad KK' = \frac{q^2}{\left(\frac{c}{2}\right)^2} M \text{ (approx.)} \quad (35)$$

$$KQ = M - KK'$$

$$\text{When } \frac{q}{c} = \frac{1}{2} \text{ as in figure, } KK' = \frac{M}{4} \text{ and } KQ = \frac{3}{4} M \text{ (approx.)}$$

$$\text{When } \frac{q}{c} = \frac{1}{4} \quad VW = \frac{15}{16} M \text{ (approx.)}$$

$$\text{When } \frac{q}{c} = \frac{3}{4} \quad TU = \frac{7}{16} M \text{ (approx.)}$$

The curve thus found is accurately a parabola, but for short distances this practically coincides with a circle.

83. II. Approximate Method. Measure LQ and QB

$$M = \frac{\left(\frac{c}{2}\right)^2}{2R} \quad KK' = \frac{q^2}{2R} \text{ (approx.) from} \quad (26)$$

$$KQ = \frac{\left(\frac{c}{2}\right)^2 - q^2}{2R} = \frac{\left(\frac{c}{2} + q\right)\left(\frac{c}{2} - q\right)}{2R} \text{ (approx.)}$$

$$KQ = \frac{AQ \times QB}{2R} \text{ (approx.)} \quad (36)$$

Sometimes one, sometimes the other of these methods will be preferable.

84. Example. Given $C = 100$, $D = 9^\circ$.

$$M = 1.965 \text{ from Tables.}$$

Required, Ordinate at point 30 ft. distant from center toward end of chord.

$$\text{I. } 30 \text{ ft.} = \frac{30}{50} \times \frac{C}{2}$$

$$KK' = \frac{9}{25} \times \frac{1.965}{9}$$

$$\begin{array}{r} 25 \overline{) 17.685} \\ \underline{.70740} \end{array}$$

$$M = \frac{1.965}{1.258}$$

$$\text{Ordinate} = \frac{1.258}{8250}$$

$$\text{Precise result for data above} = 1.260.$$

$$\text{II. } AQ = 80$$

$$BQ = 20$$

$$1273.4 \overline{) 1600} \quad (1.256)$$

$$\underline{1273.4}$$

$$R_1 = 5730. \quad \underline{32660}$$

$$R_9 = 636.7 \quad \underline{25468}$$

$$2R_9 = 1273.4 \quad \underline{71920}$$

$$\underline{63670}$$

$$\underline{8250}$$

85. Problem. *Given R and c .*

Required a series of points on the curve.

$$M = HL = \frac{c^2}{8R} \text{ (approx.)}$$

$$RS = \frac{AH^2}{8R} \text{ (approx.)} \quad AH = \frac{c}{2} \text{ (approx.)}$$

$$RS = \frac{\frac{c^2}{4}}{8R} = \frac{M}{4} \text{ (approx.)}$$

$$PN = \frac{RS}{4} \text{ (approx.)}, \text{ etc., as far as desirable.}$$

This method is useful for many general purposes, for ordinates in bending rails among others.

86. Problem. *Given a Simple Curve joining two tangents. Required the P.C. of a new curve of the same radius which shall end in a parallel tangent.*

Let AB be the given curve.

$A'B'$ " " required curve.

$B'E = p$ = perpendicular distance between tangents.

Join BB' .

Then $AA' = OO' = BB'$

Also $B'BE = V'VB = I$

$$BB' \sin I = p$$

$$BB' = AA' = \frac{p}{\sin I} \quad (37)$$

When the proposed tangent is *outside* the original tangent, the distance AA is to be added to the station of the P.C. When *inside*, it is to be subtracted.

87. Problem. *Given a Simple Curve joining two tangents. Required the Radius of a new curve which with the same P.C. shall end in a parallel tangent.*

Let AB be the given curve of radius $R = AO$.

$B'E = p =$ perpendicular distance.

AB' the required curve, radius $= R'$.

Draw chords AB, AB' ;

also line BB' ;

also BL parallel to AO.

Then

$$BLB' = AO'B' = I$$

$$BL = OO'$$

$$= R' - R$$

$$= B'L$$

Therefore

$$BL \text{ vers } BLB' = B'E$$

$$(R' - R) \text{ vers } I = p$$

$$(R' - R) = \frac{p}{\text{vers } I} \quad (38)$$

Since $VAB = V'AB'$, AB and AB' are in the same straight line.

And with transit at A, point B' can be set by measuring BB' in direction AB.

$$\text{Also } BB' = \frac{B'E}{\sin B'BE} \quad \text{or } BB' = \frac{p}{\sin \frac{1}{2} I} \quad (39)$$

When the proposed tangent is *outside* the original tangent (as it is shown in the figure), the above formula applies, and

$$R' > R.$$

When the proposed tangent is *inside* the original tangent, the formula becomes

$$R - R' = \frac{p}{\text{vers } I} \quad (40)$$

and $R' < R$.

- 88. Problem.** *Given a Simple Curve joining two tangents. Required the radius and P.C. of a new curve to end in a parallel tangent with the new P.T. directly opposite the old P.T.*

Let AB be the given curve of radius = R .

A'B' the required curve of radius R' .

$$BB' = p.$$

Draw perpendicular $O'N$
and arc NM

$$\begin{aligned} \text{Then } O'M &= B'M - B'O' \\ &= B'M - BM = BB' \end{aligned}$$

$$O'M = p$$

$$ON \text{ exsec } NOO' = O'M$$

$$(R - R') \text{ exsec } I = p; \quad R - R' = \frac{p}{\text{exsec } I} \quad (41)$$

$$AA' = O'N = ON \tan NOO'$$

$$AA' = (R - R') \tan I \quad (42)$$

When the new tangent is *outside* the original tangent (as in the figure), $R > R'$ and AA' is added to the station of the P.C.

When the new tangent is *inside* the original tangent, $R < R'$, $R' - R = \frac{p}{\text{exsec } I}$, and AA' is subtracted from station of P.C.

- 89. Problem.** *To find the Simple Curve that shall join two given tangents and pass through a given point.*

With the transit at V, the given point K can often be best fixed by angle BVK and distance VK. If the point K be fixed by other measurements, these generally can readily be reduced to the angle BVK and distance VK.

90. Problem. *Given the two tangents intersecting at V, the angle I, and the point K fixed by angle BVK = β and distance VK = b .*

Required the radius R of curve to join the two tangents and pass through K.

In the triangle VOK we have given

$$VK = b \text{ and } \angle OVK = \frac{180 - I}{2} - \beta$$

Further $VO = \frac{R}{\cos \frac{1}{2} I}$ $OK = R$

$$VO : OK = \sin \angle VKO : \sin \angle OVK$$

$$\frac{R}{\cos \frac{1}{2} I} : R = \sin \angle VKO : \cos(\frac{1}{2} I + \beta)$$

$$\sin \angle VKO = \frac{\cos(\frac{1}{2} I + \beta)}{\cos \frac{1}{2} I} \quad (43)$$

From data thus found, the triangle VOK may be solved for R .

In solving this triangle the angle VOK is often very small. A slight error in the value of this small angle may occasion a large error in the value of R . In this case use the following **Second Method** of finding R after VOK has been found.

Find $\angle AOK = \frac{1}{2} I + \angle VOK$ Also $\angle DVK = I + \beta$

Then $R \text{ vers } \angle AOK = LK$

$$= b \sin \angle DVK$$

$$R = \frac{b \sin \angle DVK}{\text{vers } \angle AOK} \quad (44)$$

91. Problem. *Given R, I, β (BVK).*

Required b (VK).

In the triangle VOK

$$OK = R; \quad OV = \frac{R}{\cos \frac{1}{2} I}$$

$$\angle OVK = 90 - (\frac{1}{2} I + \beta)$$

Solve triangle for b .

Also find VOK and station of K if desired.

92. Problem. *To find the point where a straight line intersects a curve between stations.*

Find where the straight line $V'K$ cuts VB at V' .

Measure $KV'B$.

Use V' as an auxiliary vertex.

Find I' from $V'B$ by (5).

Solve by preceding problem.

93. Approximate Method.

Set the middle point H by method of ordinates.

If the arc HB is sensibly a straight line, find the intersection of HB and CD .

Otherwise set the point G by method of ordinates, and get intersection of HG and CD .

Additional points on the arc may be set if necessary, and the process continued until the required precision is secured.

The points H and G can be set without the use of a transit with sufficient accuracy for many purposes, a plumb line or flag being used in "sighting in."

94. Problem. *Given a Simple Curve and a point outside the curve.*

Required a tangent to the curve from that point.

Let BDE be the given curve.

P the point outside the curve.

BL a tangent at B .

Measure LBP , also BP .

In the triangle BPO we have given PBO, BP, BO.

Solve the triangle for BOP and OP.

Then $\cos \text{DOP} = \frac{\text{OD}}{\text{OP}} = \frac{R}{\text{OP}}$

$$\text{BOD} = \text{BOP} - \text{DOP}$$

From BOD find station of D from known point B.

It should be noted that if $\log OP$ is found, this can be used again without looking out the number for OP . Other similar cases will occur elsewhere in calculation.

When for any reason it is difficult or inconvenient to measure BP directly, the angles CBP, BCP and the distance BC may be measured and BP calculated.

94 A. Tentative Method.

Field-work.

(a) From the station (B) nearest to the required point D, find by the approximate method where BP cuts the curve at C. (If E be the nearest station, produce PC to B.)

(b) Assume D with BD slightly greater than CD, and with transit at $P.C.$ set the point D (transit point) truly on the curve.

(c) Move the transit to D, and lay off a tangent to the curve at D. This will very nearly strike P.

(d) If the tangent strikes away from P, at Q, measure QDP, and move the point D (ahead or back as the case may be) a distance c due to an angle at the center $d = QDP$. The tangent from this new point ought to strike P almost exactly.

In a large number of cases the point D will be found on the first attempt sufficiently close for the required purpose.

If a tangent between two curves is required, similar methods by approximation will be found available.

97. When the P.C. is inaccessible.

Establish some point D, (an even station is preferable) by method of "offsets from Tangent" or otherwise.

Move transit to B (P.T.) and run out curve starting from D and checking on tangent VB.

**98. When the P.T. is inaccessible.**

With instrument still at V, set some convenient point D, move transit to P.C., and run in curve to D, and then pass the obstacle at B as any obstacle on a tangent would be passed.

99. When Obstacles on the Curve occur so as to prevent running in the curve, no general rules can well be given. Sometimes *resetting* the transit in the curve will serve. Sometimes, if one or two points only are invisible from the transit, these can be set by "*deflection distances*," and the curve continued by "*deflection angles*," without resetting the transit. Sometimes "*offsets from the tangent*" can be used to advantage. Sometimes points can be set by "*ordinates*" from chords. Sometimes the method shown on page 54, § 92, assuming an auxiliary V, is the only one possible.

It should be borne in mind that it is seldom *necessary* that the *full stations* should be set. If it be possible to set any points whose stations are known and which are not too far apart, this is generally sufficient.

Finally, for passing obstacles and for solving many problems which occasionally occur, it is necessary to understand the various methods of laying out curves, and to be familiar with the mathematics of curves; and, in addition, to exercise a reasonable amount of ingenuity in the application of the knowledge possessed.

CHAPTER V.

COMPOUND CURVES.

100. When one curve follows another, the two curves having a common tangent at the point of junction, and lying upon the same side of the common tangent, the two curves form a *Compound Curve*.

When two such curves lie upon opposite sides of the common tangent, the two curves then form a *Reversed Curve*.

In a compound curve, the point at the common tangent where the two curves join, is called the *P.C.C.*, meaning the "point of compound curvature."

In a reversed curve, the point where the curves join is called the *P.R.C.*, meaning the "point of reversed curvature."

Field-work.

Laying out a compound curve or a reversed curve.

(a) Set up transit at *P.C.*

(b) Run in simple curve to *P.C.C.* or *P.R.C.*

(c) Move transit to *P.C.C.* or *P.R.C.*

(d) Set line of sight on common tangent with vernier at 0° by method of § 60.

(e) Run out second curve as a simple curve.

Data Used in Compound Curve Formulas.

In the curve of larger radius, $OA = R_l$; $AOC = I_l$; $AV = T_l$.

In the curve of shorter radius, $PB = R_s$; $BPC = I_s$; $VB = T_s$;

Also $LVE = I$.

101. Problem. *Given R_l, R_s, I_l, I_s .*

Required I, T_l, T_s .

Draw the common tangent DCE.

Then $I = I_l + I_s$

$$AD = CD = R_l \tan \frac{1}{2} I_l$$

$$EB = CE = R_s \tan \frac{1}{2} I_s$$

or find CD and CE, using Allen's Table III. and the correction, Table IV.

In the triangle DVE we have one side and three angles

$$DE = R_l \tan \frac{1}{2} I_l + R_s \tan \frac{1}{2} I_s \quad (45)$$

$$\angle VDE = I_l; \angle VED = I_s; \text{ and } \angle DVE = 180 - I$$

Solve for VD and VE then $AV = AD + VD = T_l$

$$VB = BE + VE = T_s$$

102. Problem. *Given T_s, R_s, I_s, I .*

Required T_l, R_l, I_l .

$$I_l = I - I_s.$$

Find $CE = EB$ from D_s and I_s (Tables III. and IV.)

Having given VE and all three angles

Solve for DE and DV; also find CD.

Then $T_l = AV = CD + DV$

$$\text{Also } R_l = \frac{CD}{\tan \frac{1}{2} I_l}$$

103. Problem. *Given T_l, R_l, I_l, I .*

Required T_s, R_s, I_s .

$$I_s = I - I_l.$$

Find $AD = DC$ from D_l and I_l (Tables III. and IV.)

Having given DV and all three angles

Solve for DE and VE; also find CE.

$$\text{Then } T_s = VB = VE + CE; \text{ and } R_s = \frac{CE}{\tan \frac{1}{2} I_s}$$

See § 105 and § 108 for other solutions of § 102 and § 103.

110. Problem. *Given, in the figure, AB, VAB, VBA, R_s .*

Required $R_l, I_l, I_s, I.$

Draw arc NP ; also perpendiculars KB, MP, SP.

$$I = VAB + VBA$$

$$\begin{aligned} NM &= AK + KM - AN \\ &= AB \sin VAB + PB \cos SPB - AN \\ &= AB \sin VAB + R_s \cos I - R_s \\ &= AB \sin VAB - R_s \text{ vers } I \end{aligned}$$

$$\begin{aligned} MP &= KB - SB \\ &= AB \cos VAB - PB \sin SPB \\ &= AB \cos VAB - R_s \sin I \end{aligned}$$

$$\tan NPM = \tan \frac{1}{2} I_l = \frac{NM}{MP} \quad (58)$$

$$I_s = I - I_l$$

$$OP = R_l - R_s = \frac{MP}{\sin I_l} \quad (59)$$

111. Problem. *Given, in the figure, AB, VAB, VBA, R_l .*

Required $R_s, I_l, I_s, I.$

Draw arc PN ; also perpendiculars PM, AS.

$$I = VAB + VBA$$

$$\begin{aligned} NM &= LK = SK - SL \\ &= OA \text{ vers } AOK - AB \sin VBA \\ &= R_l \text{ vers } I - AB \sin VBA \end{aligned}$$

$$\begin{aligned} MP &= AS - AT \\ &= OA \sin AOK - AB \cos VBA \\ &= R_l \sin I - AB \cos VBA \end{aligned}$$

$$\tan NPM = \frac{NM}{MP} \quad (60)$$

$$\tan \frac{1}{2} I_s = \frac{NM}{MP}$$

$$I_l = I - I_s \quad (61)$$

$$OP = R_l - R_s = \frac{MP}{\sin I_s}$$

112. Problem. *Given a Simple Curve ending in a given tangent.*

A second curve of given radius is to leave this and end in a given parallel tangent.

Required the P.C.C.

Let AB be the given curve of radius R_1 .

C be the P.C.C.

CB' the second curve of radius R_2 .

BE = p = distance between tangents.

Then MN = EB = p .

$$\text{vers COB} = \frac{MN}{OP}$$

$$\text{vers COB} = \frac{p}{R_1 - R_2} \quad (62)$$

113. Given, a Simple Curve of radius R_1 ; also a line not tangent to this curve.

Required, the radius R_2 of a second curve to connect a given point on this curve as a P.C.C., with the given line as a tangent.

Let AC be the given curve of radius R_1 .

LB the given line.

C be a point selected (as convenient or necessary) as the given P.C.C.

CB the required curve of radius R_2 .

From C lay off auxiliary tangent CD cutting LB at K.

Measure CK and angle DKB

$$\text{Then } R_2 = \frac{CK}{\tan \frac{1}{2} \text{DKB}} \quad (63)$$

$$KB = CK$$

This fixes the position of B, the P.T., thus allowing a "check" on the field-work.

114. Given a Simple Curve of radius R_1 ; also a line not tangent to this curve.

Required, the P.C.C. of a second curve of given radius R_2 to leave this curve and join the given line as a tangent.

Let ACHE be the given curve.

TB the given line.

AO radius R_1 .

PC radius R_2 .

CB required second curve.

C required P.C.C.

From a convenient point H on the given curve lay off auxiliary tangent HK cutting TB at K.

Measure HK and angle TKH.

Then $HOL = TKH$

$$LE = SL - SE \\ = HK \sin TKH - OH \text{ vers } HOL$$

$$p = HK \sin TKH - R_1 \text{ vers } TKH$$

Also

$$DB = MB - MD$$

$$MN = MB - NB = DB = p$$

$$MN = PO \text{ vers } OPN$$

$$\frac{p}{(R_2 - R_1)} = \text{vers } I_2 \quad (64)$$

The angle AOH is given.

$$CPB - TKH = COH$$

$$AOH - COH = AOC = I_1$$

This serves to fix station of P.C.C. at C.

Also

$$KB = KL + LB$$

$$= HS - HK \cos TKH + LB$$

$$= OH \sin TKH - HK \cos TKH + OP \sin OPN$$

$$KB = R_1 \sin TKH - HK \cos TKH + (R_2 - R_1) \sin I_2$$

115. Problem. *Given a Compound Curve ending in a given tangent.*

Required to change the P.C.C. so as to end in a given parallel tangent, the radii remaining unchanged.

I. When the new tangent lies outside the old tangent, and the curve ends with curve of larger radius.

Let ACB be the given compound curve.

AC'B'' the required curve.

Produce C'O to P', draw arc C'B'' and connect P'B''.

Produce arc AC to B' and connect OB'.

Draw perpendiculars C'SD, CTK, B'LE', and BE.

$$\begin{aligned} \text{Then } EB'' &= E'B'' - LB \\ &= DB'' - SB' - (KB - TB') \\ &= P'C' \text{ vers } C'P'B'' - OC' \text{ vers } C'OB' \\ &- (PC \text{ vers } CPB - OC \text{ vers } COB') \\ p &= (R_l - R_s) \text{ vers } I_l' - (R_l - R_s) \text{ vers } I_l \end{aligned}$$

$$\frac{p}{R_l - R_s} = \text{vers } I_l' - \text{vers } I_l. \quad (65)$$

116. II. When the new tangent lies inside the old tangent, and the curve ends with the curve of larger radius.

$$\frac{p}{R_l - R_s} = \text{vers } I_l - \text{vers } I_l'. \quad (66)$$

117. III. When the new tangent lies outside the old tangent, and the curve ends with curve of smaller radius.

With a new figure it may be shown that

$$\frac{p}{R_l - R_s} = \text{vers } I_s - \text{vers } I_s'. \quad (67)$$

118. IV. When the new tangent lies inside the old tangent, and the curve ends with curve of smaller radius.

$$\frac{p}{R_l - R_s} = \text{vers } I_s' - \text{vers } I_s. \quad (68)$$

CHAPTER VI.

REVERSED CURVES.

It is considered undesirable that reversed curves should be used on main lines, or where trains are to be run at any considerable speed. The marked change in direction is objectionable, and an especial difficulty results from there being no opportunity to elevate the outer rail at the *P.R.C.* The use of reversed curves on lines of railroad is therefore very generally condemned by engineers. For yards and stations, reversed curves may often be used to advantage, also for street railways, and perhaps for other purposes.

119. Problem. *Given the perpendicular distance between parallel tangents, and the common radius of the reversed curve.*

Required the central angle of each curve.

Let AH and BD be the parallel tangents.

ACB the reversed curve.

HB = p = perpendicular distance between tangents.

Draw perpendicular NM.

Let $\text{AOC} = \text{BPC} = I_r$.

Then

$$\text{vers AOC} = \frac{AN}{AO} = \frac{BM}{PB} = \frac{\frac{1}{2}HB}{AO}$$

$$\text{vers } I_r = \frac{\frac{1}{2}p}{R} \quad (69)$$

120. Problem. *Given p , I_r .*

Required R .

$$R = \frac{\frac{1}{2}p}{\text{vers } I_r} \quad (70)$$

121. Problem. Given the perpendicular distance p between parallel tangents, the chord distance d between P.C. and P.T.; and one radius R_1 of a reversed curve. Required the second radius R_2 .

Let ACB = reversed curve.

AH, DB parallel tangents.

$$AB = d \quad BH = p$$

$$OA = R_1 \text{ and } PB = R_2$$

Connect AC and CB.

$$AOC = BPC \text{ and } ACO = PCB$$

ACB is a straight line.

Draw MP parallel to AB, OK perpendicular to MP.

$$MP = AB \text{ and } AM = BP$$

$$OM : MK = AB : BH$$

$$R_1 + R_2 : \frac{1}{2} d = d : p \quad \text{or} \quad R_1 + R_2 = \frac{d^2}{2p} \quad (71)$$

$$\text{When } R_1 = R_2 = R \quad R = \frac{d^2}{4p} \quad (72)$$

122. Problem. Given R and p . Required d .

$$\text{From (71)} \quad d = \sqrt{2(R_1 + R_2)p} \quad (73)$$

$$\text{When } R_1 = R_2 = R \quad d = \sqrt{4Rp} = 2\sqrt{Rp} \quad (74)$$

123. Problem. Given the perpendicular distance between two parallel tangents, and the central angle and radius of first curve of reversed curve.

Required the radius of second curve.

Let ACB = reversed curve

$$HB = p; AO = R_1; PB = R_2$$

$$AOC = CPB = I_r$$

Draw perpendicular NCM.

$$HB = AN + MB$$

$$= AO \text{ vers } AOC + BP \text{ vers } BPC$$

$$p = R_1 \text{ vers } I_r + R_2 \text{ vers } I_r$$

$$R_1 + R_2 = \frac{p}{\text{vers } I_r} \quad (75)$$

124. Problem. Given R_1, R_2, p .
Required I_r .

from (75) $\text{vers } I_r = \frac{p}{R_1 + R_2}$ (76)

125. Problem. Given a *P.C.* upon one of two tangents not parallel, also the tangent distance from *P.C.* to *V*, also the angle of intersection, also the unequal radii of a reversed curve to connect the tangents.

Required the central angles of the simple curves, and tangent distance, *V* to *P.T.*

Let $AV = T_1$ = given tangent distance	A = given <i>P.C.</i>
ACB = required curve	V = vertex
$AOC = I_1$	$AVT = I$
$BPC = I_2$ } required angles	$AO = R_1$ } given radii
$BV = T_2$ = required tangent distance	$PB = R_2$ }
	VT = second tangent

Draw arc AL , also perpendiculars OL, AS, AK .

Then $LT = p$ = perpendicular distance between parallel tangents and by (75) $p = (R_1 + R_2) \text{vers } LOC$

$$\begin{aligned}
 LT &= LK + AS \\
 (R_1 + R_2) \text{vers } LOC &= AO \text{vers } AOL + AV \sin I \\
 (R_1 + R_2) \text{vers } I_2 &= R_1 \text{vers } I + T_1 \sin I \\
 \text{vers } I_2 &= \frac{R_1 \text{vers } I + T_1 \sin I}{R_1 + R_2} \quad (77) \\
 I_1 &= I_2 - I
 \end{aligned}$$

$$\begin{aligned}
 BV &= VS + AK - TB \\
 T_2 &= T_1 \cos I + R_1 \sin I - (R_1 + R_2) \sin I_2 \quad (78)
 \end{aligned}$$

126. Problem. *Given BV instead of AV, and other data as above.*

Required I_1, I_2 , etc.

Draw perpendiculars PH, BF, BG.

$UH = p$ = perpendicular distance between parallel tangents.

$$\begin{aligned} \text{UH} &= \text{FH} + \text{GB} \\ (R_1 + R_2) \text{ vers } I_1 &= R_2 \text{ vers } I + T_2 \sin I \\ \text{vers } I_1 &= \frac{R_2 \text{ vers } I + T_2 \sin I}{R_1 + R_2} \end{aligned} \quad (79)$$

CHAPTER VII.

PARABOLIC CURVES.

129. Instead of circular arcs to join two tangents, parabolic arcs have been proposed and used, in order to do away with the sudden changes in direction which occur where a circular curve leaves or joins a tangent. Parabolic curves have, however, failed to meet with favor for railroad curves for several reasons.

1. Parabolic curves are less readily laid out by instrument than are circular curves.

2. It is not easy to compute at any given point the radius of curvature for a parabolic curve ; it may be necessary to do this either for curving rails or for determining the proper elevation for the outer rail.

3. The use of the "Spiral," or other "Easement," or "Transition " curves secures the desired result in a more satisfactory way.

There are however many cases (in Landscape Gardening or elsewhere) where a parabolic curve may be useful either because it is more graceful or because, without instrument, it is more easily laid out, or for some other reason.

It is seldom that parabolic curves would be laid out by instrument.

130. Properties of the Parabola.

(a) The locus of the middle points of a system of parallel chords of a parabola is a straight line parallel to the axis of the parabola (*i.e.* a diameter).

(b) The locus of the intersection of pairs of tangents is in the diameter.

(c) The tangent to the parabola at the vertex of the diameter is parallel to the chord bisected by this diameter.

(d) Diameters are parallel to the axis.

(e) The equation of the parabola, the coördinates measured upon the diameter and the tangent at the end of the diameter is

$$y'^2 = \frac{4p}{\sin^2 \theta} x'$$

or $y^2 = 4p'x$ (82)

131. Problem. *Given two tangents to a parabola, also the position of P.C. and P.T.*

Required to lay out the parabola by "offsets from the tangent."

Let AV, VB be the given tangents (not necessarily equal), and AHB the parabolic curve.

Join the chord AB; draw VG bisecting AB.

Draw AX, BY, parallel to VG; produce AV to Y,

Then VG is a diameter of the parabola.

AX parallel to VG is also a diameter.

The equation of the parabola referred to AX and AY as axes is

$$y^2 = 4p'x.$$

Instead of solving this equation engineers commonly use the proportion

$$y_1^2 : y_2^2 = x_1 : x_2 \quad (83)$$

Hence

$$AV^2 : AY^2 = HV : BY$$

$$AV^2 : (2 AV)^2 = HV : 2 GV$$

$$1 : 4 = HV : 2 GV$$

$$HV = \frac{GV}{2} \quad (84)$$

Next bisect VB at D.

Draw CD parallel to AX.

Then

$$BD^2 : BV^2 = CD : HV$$

$$CD = \frac{HV}{4}$$

Similarly, make

$$AN = NF = FV$$

Then

$$KN = \frac{HV}{9}$$

$$EF = \frac{4}{9}HV$$

In a similar way, as many points as are needed may be found.

132. Field-work.

(a) Find G bisecting AB.

(b) Find H bisecting GV.

(c). Find points P, Q, and N, F, dividing AG, AV, proportionately ; also R and D, dividing GB and BV proportionately.

Use simple ratios when possible (as $\frac{1}{2}$, $\frac{1}{3}$, etc.).

(d) Lay off on PN, the calculated distance KN

on QF lay off EF

on RD lay off CD

In figure opposite,

$$KN = \frac{HV}{9}$$

$$CD = \frac{HV}{4}$$

$$EF = \frac{4}{9}HV$$

For many purposes, or in many cases, it will give results sufficiently close, to proceed without establishing P, Q, R ; the directions of NK, EF, CD, being given approximately by eye. When the angle AVG is small (as in the figure), it will generally be necessary to find P, Q, R, and fix the directions in which to measure NK, EF, CD. When the angle AVG is large (greater than 60°) and the distances NK, EF, CD are not large, it will often be unnecessary to do this. No fixed rule can be given as to when approximate methods shall be used. Experience educates the judgment so that each case is settled upon its merits.

133. Problem. *Given two tangents to a parabola, also the positions of P.C. and P.T.*

Required to lay out the parabola by "middle ordinates."

The ordinates are taken from the middle of the chord, and parallel to GV in all cases.

Field-work.

- Establish H as in last problem.
- Lay off $SE = \frac{1}{4} HV$; also $TC = \frac{1}{4} HV$.
- Lay off $UW = \frac{1}{4} TC$, and continue thus until a sufficient number of points is obtained.

The length of curve can be conveniently found only by measurement on the ground.

Note the difference in method between § 85 and § 133.

134. Vertical Curves.

It is convenient and customary to fix the grade line upon the profile as a succession of straight lines; also to mark the elevation above datum plane of each point where a change of grade occurs; also to mark the rates of grade in feet per station of 100 feet. At each change of grade a vertical angle is formed. To avoid a sudden change of direction it is customary to introduce a vertical curve at every such point where the angle is large enough to warrant it. The curve commonly used for this purpose is the parabola. A circle and a parabola would substantially coincide where used for vertical curves. The parabola effects the transition rather better theoretically than the circle, but its selection for the purpose is due principally to its greater simplicity of application. It is generally laid to extend an equal number of stations on each side of the vertex.

135. Problem. *Given the elevations above datum plane of grade line at the vertex, and at given points at equal distances each side of vertex, as P.C. and P.T.*

Required elevation of the vertical curve opposite the vertex; also at intermediate points.

Let A, V, B be the given points,
AHB the parabola.

Join AB; produce AV to Y.

Draw vertical lines AX, LGHV, MBY, and horizontal line ALM.

In the case of a vertical curve, the horizontal projections of AV and VB are equal, and AL = ML.

Therefore AG = GB, and AV = VY

VG is a diameter of the parabola.

AX is also a diameter.

$$HV = \frac{VG}{2}$$

$$\text{Elev. H} = \frac{1}{2} \left(\frac{\text{Elev. A} + \text{Elev. B}}{2} + \text{Elev. V} \right) \quad (85)$$

The elevations of A, B, V, H, are all above "datum plane."

For intermediate points following § 131,

Let LU = UM.

$$\text{Elev. C} = \text{Elev. D} + \frac{HV}{4}$$

Let AS = ST = TL.

$$\text{Elev. K} = \text{Elev. N} + \frac{HV}{9}$$

$$\text{Elev. E} = \text{Elev. F} + \frac{4}{9} HV$$

A method better and more convenient for use is given below.

$$DD'' = q; \quad D'D'' = q - \alpha_1$$

$$EE' = 2g; \quad E'E'' = 2g - a_2 = 2g - 4a_1$$

$$VL = 3g; \quad HL = 3g - a_3 = 3g - 9a_1$$

Again, $D'D'' = g - a_1 = g - a_1$

$$E'E'' - D'D'' = 2g - 4a_1 - (g - a_1) = g - 3a_1$$

$$\text{HL} - E'E'' = 3g - 9a_1 - (2g - 4a_1) = g - 5a_1$$

On a straight grade, the elevation of any station is found from the preceding, by adding a constant q .

On a vertical curve, the elevation of each station is found from the preceding by adding, in a similar way, not a constant, but a varying increment, being for the

1st station from A = $g - a_1$	} changing by successive
2d " " A = $g - 3 a_1$	
3d " " A = $g - 5 a_1$	

differences of $2 a_1$ in each case.

137. The Am. Ry. Eng. Assn. states as to length of vertical curves that "on Class A roads" (roads with large traffic) "rates of change of 0.10 per station on summits, and 0.05 per station in sags should not be exceeded. On minor roads 0.20 per station on summits, and 0.10 per station in sags may be used." With very steep grades, however, even higher rates than recommended by the Association may sometimes seem necessary.

The "rate of change per station" corresponds to $2\alpha_1$ in the foregoing formulas.

Let r = rate of change per station.

Then from (86) $r = \frac{g - g'}{n}$

Also
$$n = \frac{g - g'}{r} \quad (87)$$

From practical considerations the vertical curve will, in general, extend an equal number of full stations on each side of the vertex.

Then n must be an even number (not odd)

$$n \geq \frac{g - g'}{r} \quad (88)$$

The rates of grade around the curve will be

$$g - \frac{1}{2}r; \quad g - 1\frac{1}{2}r; \quad g - 2\frac{1}{2}r, \text{ etc.}$$

Each rate differing by r from the preceding.

138. Example.

Given. Grades as follows :

Sta.	Elev.	Rate
5	117.00	+ 1.00
10	122.00	+ 0.40
15	124.00	

Then $n = 10$ ($g - g'$)

$$= 10 \times 0.60$$

$$= 6$$

$$a_1 = \frac{1}{2}r = \frac{g - g'}{2n}$$

$$= \frac{0.60}{12}$$

$$= 0.05$$

$$r = 0.10$$

Sta.	Elev.	
5	117.00	
	+ 1.00	$= g$
6	118.00	
	+ 1.00	$1.00 = g$
7	119.00	$- 0.05 = \frac{1}{2}r$
	+ 0.95	$0.95 = g - \frac{1}{2}r$
8	119.95	$- 0.10 \quad - \quad r$
	+ 0.85	$0.85 \quad g - 1\frac{1}{2}r$
9	120.80	$- 0.10 \quad - \quad r$

15	124.00	

The elevation for Sta. 15 thus obtained agrees with the elevation shown in the data. All the intermediate elevations are therefore "checked."

CHAPTER VIII.

TURNOUTS.

139. A Turnout is a track leading from a main or other track.

Turnouts may be for several purposes.

- I. *Branch Track* (for line used as a Branch Road for general traffic).
- II. *Siding* (for passing trains at stations, storing cars, loading or unloading, and various purposes).
- III. *Spur Track* (for purposes other than general traffic, as to a quarry or warehouse).
- IV. *Cross Over* (for passing from one track to another, generally parallel).

The essential parts of a turnout are

1. *The Switch.*
2. *The Frog.*
3. *The Guard Rail.*

1. Some device is necessary to cause a train to turn from the main track ; this is called the "*Switch.*"

2. Again, it is necessary that one rail of the turnout track should cross one rail of the main track ; and some device is necessary to allow the flange of the wheel to pass this crossing ; this device is called a "*Frog.*"

3. Finally, if the flange of the wheel were allowed to bear against the point of the frog, there is danger that the wheel might accidentally be turned to the wrong side of the frog point. Therefore a *Guard Rail* is set opposite to the frog, and this prevents the flange from bearing against the frog point.

Frogs are of various forms and makes, but are mostly of this general shape, and the parts are named as follows:—

This shows the “stiff” frog.

The “spring” frog is often used where the traffic on the main line is large, and on the turnout small. In the spring frog $W'W'$ is movable. AD represents the main line, and $W'W'$ is pushed aside by the wheels of a train passing over the turnout.

Frogs are made of certain standard proportions, and are classified by their number.

The “Number” n of a frog is found by dividing the length of the tongue by the width of the heel; $n = \frac{PH}{AB} = \frac{LH}{KD + AB}$.

The “Frog angle” is the angle between the sides of the tongue of the frog = APB .

140. Problem. Given n . Required Frog Angle F .

$$\cot \frac{1}{2} F = \frac{PH}{\frac{1}{2} AB}$$

$$\cot \frac{1}{2} F = 2n \quad (89)$$

The frog is not brought to a fine “theoretical” point or edge; but is left blunt at the “actual” point; present practice leaves the frog one half inch thick at the actual point.

Let b = thickness at actual point.

Then nb = distance, theoretical to actual point of frog.

141. The form of switch commonly used at the present time is the "split switch." Fig. A shows the switch set for the turnout, and Fig. B for the main line. With the split switch the

Fig. A

Fig. B

outer rail of the main line and the inner rail of the turnout curve are continuous. The switch rails, AB and CD, are each planed down at one end to a wedge point, so as to lie, for a portion of their length, close against the stock rail, and so guide the wheel in the direction intended. An angle, called the switch angle, is thus formed between the gauge lines of the stock rail and the switch rail, as DCE of Fig. B. The switch rails are connected by several tie rods, and one of the rods, near the point, is connected with another rod which goes to the switch stand S (or to a connection with the interlocking tower) from which the point of switch is thrown either for main track or for turnout as desired. The joint between the fixed end of the switch rail and the connecting rail, at B or D, is not bolted tight enough to prevent the slight motion of the switch rail necessary. The switch rail thus fastened at the end B is not spiked at all for its entire length, and acts as a hinged piece. Both rails thus move together, and through their entire length slide on flat steel plates provided for that purpose. The fixed (or hinged) end of this rail B is placed far enough from the stock rail to allow satisfactory spiking. This is $6\frac{1}{2}$ inches, with the length of switch rail varying from 11 feet to 33 feet, in the standards of the Am. Ry. Eng. Ass'n. Standard gauge of track is $4' 8\frac{1}{2}''$.

The switch rail is not planed to a fine edge but is left with appreciable thickness, frequently one quarter of an inch. The point is not left really blunt but is shaped down through a short distance from the point so that the wheel flange shall safely pass by.

In the case of the frog it seems necessary to distinguish carefully between the theoretical point and the actual point. With the switch there is no occasion to consider the theoretical point; the actual point, or the movable end of the switch rail, is the only point necessary to consider.

In laying out a turnout from a straight track, the switch rail is straight; the frog is also straight; a circular curve, called the lead curve, is introduced to connect these, and lie tangent to them.

142. Problem. *Given in a turnout, the gauge of track g ; length of switch rail l ; thickness at point w ; heel distance between gauge sides of rails t ; distance from theoretical point to toe of frog k ; frog angle F and number n ; thickness of frog at its point b .
Required, radius of lead curve R ; also lead E from point of switch to theoretical point of frog, and also to actual point of frog.*

Let $EILF$ and CDF be the rails of turnout,

EI and CD the switch rails.

ID is perpendicular to QDF .

Draw parallels and perpendiculars IM , LN , OM , LP , also arc LA .

Let S = switch angle HEI ,

t = heel distance HI ,

$l = EI = QD = CD$,

w = thickness of switch rail at E .

$$\sin S = \frac{t - w}{l} \quad (90)$$

$$\begin{aligned} MN &= HD - HI - LP = MO - NO \\ &= g - t - k \sin F = \left(R + \frac{g}{2}\right) \cos S - \left(R + \frac{g}{2}\right) \cos F \end{aligned}$$

$$R + \frac{g}{2} = \frac{g - t - k \sin F}{\cos S - \cos F} = \frac{g - t - k \sin F}{2 \sin \frac{1}{2}(F + S) \sin \frac{1}{2}(F - S)} \quad (91)$$

Let E_t = lead, point of switch to theoretical point of frog

E_a = lead, point of switch to actual point of frog

$$\begin{aligned} QF &= QD + BL + PF \\ &= QD + \frac{IB}{\tan \angle LB} + LF \cos LFP \end{aligned}$$

$$E_t = l + \frac{g - t - k \sin F}{\tan \frac{1}{2}(F + S)} + k \cos F \quad (92)$$

$$E_a = l + \frac{g - t - k \sin F}{\tan \frac{1}{2}(F + S)} + k \cos F + bn \quad (93)$$

143. *Given for the above turnout, F, S, g, k, E_a*

Required in the figure above, the closure DA between heel of switch rail and toe of frog; also closure $\angle L$ of curved rail.

$$DA = E_a - l - k - bn \quad (94)$$

$$\angle L = \left(R + \frac{g}{2}\right) \text{ angle } (F - S)$$

Since DA as computed is independent of R and $\angle L$ is dependent upon R , any lack of precision in computing R will affect the difference between DA and $\angle L$, and l will not be exactly opposite D, as assumed.

The difference between $\angle L$ and DA may be conveniently found with adequate precision as follows:

$$\begin{aligned} DA &= NL - MI - AP \\ &= \left(R + \frac{g}{2}\right) \sin F - \left(R + \frac{g}{2}\right) \sin S - k \text{ vers } F \end{aligned}$$

$$\angle L = \left(R + \frac{g}{2}\right) \text{ angle } (F - S)$$

$$\angle L - DA = \left(R + \frac{g}{2}\right) [\text{angle } (F - S) - \sin F + \sin S] + k \text{ vers } F \quad (95)$$

144. Given for a turnout, R, l, t, S, F .

Required co-ordinates to curved rail at quarter points
A, B, C.

Consider center of curve to be marked O.

Produce curve DI to U where it is parallel to EH.

Draw perpendiculars IH, AA', BB', CC'.

$$UW = t - \left(R + \frac{g}{2} \right) \text{vers } S = a \quad (96)$$

$$EW = \left(R + \frac{g}{2} \right) \sin S - l = d \quad (97)$$

$$IOD = F - S$$

$$UOA = S + \frac{1}{4}(F - S)$$

$$UOB = UOA + \frac{1}{4}(F - S)$$

$$UOC = UOB + \frac{1}{4}(F - S)$$

$$UOD = UOC + \frac{1}{4}(F - S)$$

$$= F \text{ (for a check)}$$

$$EH = l \quad (\text{without error of more than 0.01 foot})$$

$$EA' = \left(R + \frac{g}{2} \right) \sin UOA - d \quad AA' = \left(R + \frac{g}{2} \right) \text{vers } UOA + a$$

$$EB' = \left(R + \frac{g}{2} \right) \sin UOB - d \quad BB' = \left(R + \frac{g}{2} \right) \text{vers } UOB + a$$

$$EC' = \left(R + \frac{g}{2} \right) \sin UOC - d \quad CC' = \left(R + \frac{g}{2} \right) \text{vers } UOC + a$$

145. To avoid cutting rails, one or the other of the "closure" rails between heel of switch and toe of frog may be made full feet without fractions. By lengthening the tangent of the switch rail beyond the heel, the lead is increased; by lengthening the tangent of the frog back of the toe, the lead is decreased. The leads found in this way are called "practical leads"; the leads previously considered are called "theoretical leads."

The Am. Ry. Eng. Ass'n has adopted certain combinations of switches and frogs as "standard" and calculated a table of radii, leads (both theoretical and practical), and co-ordinates of quarter points. Table XXII A and XXII B show these.

147. It has become the custom to stake out the position of the frog point F . From this point F , a good track foreman will

A **B** work backward and lay out the

L turnout according to the standard
T plan.

For any continuance of turnout beyond the point of frog, where this is a matter of fieldwork, a very

common practice is as follows :

- (a) Set the transit opposite the point of frog, at T .
- (b) Lay off on the transit (on the proper side of 0°) the value of the frog angle F .
- (c) Sight in the direction TH , parallel to AB .
- (d) Turn off $HTG = F$.
- (e) The transit then sights along TG with vernier at 0° .

Any curve desired may then be laid off conveniently by deflection angles, and this curve will connect at T (opposite F) with whatever arrangement of track extends backward from the point of frog to the point of switch. Where the line in advance of F is new location, TG is the basis for that location ; TG is either continued as a straight line, or it becomes the tangent to a desired curve and the transit is already set on TG with the vernier at 0° . When the turnout is to connect with some track parallel to the main track, the simplest method is to resolve the problem into a case of reversed curves with parallel tangents, by the following method, similar to that of § 125. If the curve used beyond F is extended backward toward the point of switch until it becomes parallel to the main track, the outer rail of this curve will not, in general, be tangent to the corresponding rail of the main track, but there will be an offset by a small distance which we may call a , and the reversed curve must be figured for a distance between parallels of $p - a$, rather than p , the actual distance between parallel tracks. If there be a turnout at each of the parallel tracks, $p - 2a$ should be used.

This method of treatment is not dissimilar to the use of p and q in spirals, and has value in many cases other than those of parallel tracks ; several cases will be treated in the next chapter.

The method of finding a follows.

149. If it be desired to use greater precision, and take into account the fact that the frog is straight from theoretical point F to heel G , and to make the curve beyond the frog tangent to FG at G ,

Let $FG = h$

Then $AD = x = \left(R + \frac{g}{2}\right) \text{vers } F - h \sin F$

$$FD = y_t = \left(R + \frac{g}{2}\right) \sin F - h \cos F$$

$$y_a = \left(R + \frac{g}{2}\right) \sin F - h \cos F + nb \quad (106)$$

$$g - x = g - \left(R + \frac{g}{2}\right) \text{vers } F + h \sin F = a \quad (107)$$

150. Problem. Given the radii R_1, R_2 , of two parts of a reversed curve extending from heel of frog to heel of frog between parallel tracks; also unequal frog angles F, F' ; also h, h' , also perpendicular distance between tracks p , and gauge g .

Required angles GOB and BPH .

Let G and H be heels of frogs F and F'

$$LK = p; \quad OB = R_1; \quad PB = R_2$$

Find $LA = a_1$ and $MC = a_2$ by (107)

$$\text{From (76)} \quad \text{vers } AOB = \frac{p - a_1 - a_2}{R_1 + R_2} \quad (108)$$

$$GOB = AOB - F \quad \text{and} \quad BPH = AOB - F'$$

151. More commonly the two frogs will have the same number and the radii of the reversed curve will be the same.

When $F = F'$ and $R_1 = R_2$

$$\text{vers } AOB = \frac{p - a - a}{R_1 + R_2} = \frac{\frac{1}{2}p - a}{R} \quad (109)$$

$$GOB = BPH = AOB - F'$$

152. Problem. Given $F = F'$, n , b ; also p , g .

Required the length l , of tangent between the two frogs.

Let F and F' be theoretical points of frogs

Draw $KTNL$ perpendicular to AB

Then

$$TN = KL - KT - NL$$

$$FN \sin TFN = p - g - F'N \cos F'NL$$

$$l \sin F = p - g - g \cos F$$

$$l = \frac{p - g - g \cos F}{\sin F} \quad (110)$$

l is the distance from the theoretical point at F to point N opposite the theoretical point at F'

The above solution holds good whatever be the turnout used.

For a crossover between existing tracks, if the distance FF' be calculated, both frog points can be located and the entire turnout staked out without transit.

from (30)
$$FF' = l + \frac{g^2}{2l} \text{ (approx.)}$$

The distance from actual point of one frog to the actual point of the other $= FF' - 2nb$.

156. A form of switch formerly in common use is the "*Stub-Switch*," which is formed by two rails, one on each side of the track, called the *Switch Rails*. One end of the rail for a short distance AC or BD (perhaps 5 or 10 feet) is securely spiked to the ties, the rest of the rail Cl or DL being free to slide on the ties, so that it may meet the fixed rails of either main track at H or N, or turnout at I or L, as desired. These fixed rails, supported on a heavy tie or *Head Block*, are held by a casting, or piece of metal called the *Head Chair*, upon which the switch rail slides. A *Switch Rod* connects the ends of the switch rails with the *Switch Stand*. Since one end of the rail is spiked down, when the free end is drawn over by the switch rod the rail is sprung into a curve which may with slight error be considered a circular curve, tangent to the main line (if this be straight). In the stub-switch the outer rail of the turnout is assumed to be tangent both to the main track at C and to the frog at its point F. The distance through which the free end of the rail is drawn or *thrown* by the switch rod is called the *Throw* of the switch; this will be 5 or 6 inches. The free end of the rail is called the *Toe*, and the *P.C.* of the curve the *Heel* of the switch.

157. Problem. Given gauge of track g ; frog angle F ; number of frog n ; and throw of switch t . Required for a stub-switch, radius of turnout curve R ; length of switch rail l ; and DF , the lead E .

Draw perpendicular FK

$$\text{COF} = F$$

$$\text{FO} = \frac{\text{CD}}{\text{vers COF}}$$

$$R + \frac{g}{2} = \frac{g}{\text{vers } F} \quad (114)$$

$$\text{DF} = \text{OF} \sin \text{DOF}$$

$$E = \left(R + \frac{g}{2} \right) \sin F \quad (115)$$

$$\text{From (26)} \quad t = \frac{l^2}{2R} \quad (\text{approx.})$$

$$l = \sqrt{2Rt} \quad (116)$$

$$DF = CD \cot CFD; \quad E = g \cot \frac{1}{2} F; \quad E = 2 gn \quad (117)$$

$$DF^2 = FO^2 - DO^2$$

$$E^2 = \left(R + \frac{g}{2} \right)^2 - \left(R - \frac{g}{2} \right)^2$$

$$E^2 = \left(R + \frac{g}{2} + R - \frac{g}{2} \right) \left(R + \frac{g}{2} - R + \frac{g}{2} \right) = 2 Rg$$

$$R = \frac{E^2}{2g} = \frac{(2gn)^2}{2g} = 2gn^2 \quad (118)$$

$$R = En$$

$$l = \sqrt{2Rt} = \sqrt{4n^2gt} = 2n\sqrt{gt}$$

These formulas in § 156 and § 157 apply only in the case of the stub-switch, and are not to be used for split-switch turnouts.

158. Problem. *Given the degree D of a stub-switch turnout from a straight track.*

Required the degree of curve D' for a stub-switch turnout from a curved main track of degree D_m , F , n , g , remaining the same.

It may be shown that for a turnout to the inside of the curve

$$D' = D + D_m \text{ (approx.)} \quad (119)$$

for a turnout outside the curve

$$D' = D - D_m \text{ (approx.)}$$

except that

$$D' = D_m - D \text{ (approx.)}$$

when

$$D_m > D$$

Take the case of the turnout on the inside of a curved main track.

When the main track is straight, g , the distance from frog point to the rail opposite, is the "tangent deflection" of § 70 for the outer rail of the turnout curve, whose degree is approximately D .

$$\text{From (26 B)} \quad a = a_1 D$$

so that

$$g = a_1 D$$

When the main line is curved, g becomes the offset between two curves, one the outer rail of the turnout curve, and the other the outer rail of main track.

Assuming the chords c for the outer rails of the turnout

curves to be equal in the two cases of straight main track and curved main track

by (27) $a_{s-l} = a_1(D_s - D_l)$

and the degree of the turnout curve must be such that

$$g = a_1(D' - D_m)$$

The values of c and E are nearly equal; so that what is true of the chord in this relation is also true of E (very closely). Therefore for a given value of E

$$D' = D + D_m \text{ (approx.)}$$

Furthermore the length of turnout curve is equal to c (very closely); for the given length $= c$ the angle $I = \frac{cD}{100} = F$, and since $D' - D_m = D$, the difference in angle $\frac{cD'}{100} - \frac{cD_m}{100} = \frac{cD}{100} = F$, so that the frog angle is not changed (materially).

Similar consideration of the two cases of turnout outside the curve of main track will show the expressions above to be true.

159. Example. Required the stub-switch turnout from a 3° main line curve using a No. 9 frog.

Table XXII shows for a No. 9 frog the

$$\text{degree of curve} = 7^\circ 31' = D$$

$$\text{The degree of main line} = 3^\circ 00' = D_m$$

$$\text{degree of turnout} = 10^\circ 31' = D' = D + D_m$$

$$\text{By precise formula} \quad 10^\circ 32' = D'$$

In a similar way for a turnout on the outside of the same curve

$$D' - D_m = D = 4^\circ 31'$$

160. Another less mathematical, but very useful illustration is this: If we conceive the straight main track and the stub-switch turnout curve to be represented by a model where the rails are made of elastic material; using a "bending process" it will follow that if the main track rails be bent into a circular curve with the turnout inside, then the rails of the turnout curve will be bent into a sharper curve, and sharper by the degree of curve D_m into which the straight track is bent. Similarly when the straight track is bent in the opposite direction, the turnout curve will become flatter by the amount of D_m .

161. Problem. Given F, n, k, g, R_m, D_m .

Required the split-switch turnout from the given curved main track.

Tables XXII A and XXII B give, for various numbers of frog, the length of switch rail l , heel distance t , lead E , radius R and degree D of lead curve, length of frog from toe to theoretical point k ; also co-ordinates to quarter points. These tables show the standards adopted by the Am. Ry. Eng. Assn. for turnouts from tangents.

For turnouts from curved tracks, applying the "bending process," l, t, k, E remain unchanged in length; this is true also of the co-ordinates at the quarter points, the y values being measured along the curved main rail and x values normal to this rail; straight rails become curved to the degree of the curved main track, track or rails already curved are bent into curves sharper than before by D_m (or flatter by D_m depending upon which side of the main track the curved track lies).

The degree of lead curve $D' = D \pm D_m$

The frog remains straight necessarily; the distance k is small for all sharp lead curves, and the resulting error will be small. Furthermore the straight frog is laid as part of the main track which is assumed to be curved, so that a correct mathematical treatment is impracticable.

The switch-rail can be and should be curved to the degree D_m . It is better to curve it in a bending machine, but it is often laid straight and the traffic depended upon to curve it to a fit against the stock rail.

162. Example. For a number 9 frog, Table XXII A gives

$$l = 16' 6''; t = 6\frac{1}{4}''; k = 6'; h = 10'.$$

Table XXII B gives for "practical leads"

$$D = 9^\circ 29'; E_a = 72.28;$$

the co-ordinates are

$$28.75, 1.02; 40.98, 1.76; 53.19, 2.75$$

In using a number 9 turnout inside a 2° curved track

$$D' = 9^\circ 29' + 2^\circ = 11^\circ 29'$$

The other linear dimensions remain unchanged.

163. Problem. Given the radial distance p between a given curved main track and a parallel siding, also frog angle F (or number n), and gauge of track g .

Required the radius R_2' of second curve to connect point of frog with siding.

I. When the siding is **outside** the main track.

Let CM be the inner rail of the given main line.

CFT inner rail of turnout.

R_m = radius of main line.

R_2' = radius of turnout.

$p = TN$ = radial distance.

Connect FT, FO. Join FS.

Let $FOT = O$.

In triangle FTO,

$$FO = R_m + \frac{g}{2} \quad TO = R_m - \frac{g}{2} + p$$

also $OFT + OTF = 180^\circ - FOT = 180^\circ - O$

$$OFT - OTF = OFT - PFT = F$$

$$\tan \frac{1}{2}(OFT + OTF) : \tan \frac{1}{2}(OFT - OTF) = TO + FO : TO - FO$$

$$\cot \frac{1}{2} O : \tan \frac{1}{2} F = 2R_m + p : p - g$$

$$\tan \frac{1}{2} O = \frac{p - g}{2R_m + p} \cot \frac{1}{2} F = \frac{p - g}{R_m + \frac{p}{2}} \cdot \frac{\cot \frac{1}{2} F}{2} = \frac{(p - g)n}{R_m + \frac{p}{2}} \quad (120)$$

Similarly $FPT = F + O$

In the triangle PFS, $\tan \frac{1}{2}(F + O) = \frac{(p - g)n}{R_2' - \frac{p}{2}}$

$$R_2' - \frac{p}{2} = \frac{(p - g)n}{\tan \frac{1}{2}(F + O)} \quad (120) \quad L = \frac{100(F + O)}{D_2'} \quad (121)$$

Since the main track is assumed to be curved past the frog and the frog is necessarily laid straight, it seems an unnecessary refinement to assume the frog straight from point to heel in this case.

164. Example.

Turnout from curve *outside* the main track.

Let $D_m = 4$; $n = 8$; $p = 15$; $g = 4.708$

Precise Method.

$$\tan \frac{1}{2} O = \frac{(p - g)n}{R_m + \frac{p}{2}} = \frac{10.292}{1440.2} \times 8 = \frac{82.336}{1440.2}$$

$$82.336 \quad \log 1.915590$$

$$1440.2 \quad \log 3.158422$$

$$\frac{1}{2} O = 3^\circ 16' 19'' \quad \tan 8.757168$$

$$\frac{1}{2} F = 3^\circ 34' 30''$$

$$R_2' - \frac{p}{2} = \frac{(p - g)n}{\tan \frac{1}{2}(F + O)} \quad \frac{1}{2}(F + O) = 6^\circ 50' 49'' \quad \tan 9.079448$$

$$= \frac{82.336}{\tan 6^\circ 50' 49''} \quad 82.336 \quad \log 1.915590$$

$$685.7 \quad \log 2.836142$$

$$\frac{1}{2} p = 7.5$$

$$R_2' = 693.2$$

$$D_2' = 8^\circ 16'.4$$

$$L = \frac{100(F + O)}{D_2'} = \frac{100 \times 13^\circ 41' 38''}{8^\circ 16'.4} = 165.5$$

Approximate Method.

Apply the "bending process" of p. 93.

In the case of a turnout from a straight main track, where $n = 8$ and $p = 15$,

$$\text{from (112)} \quad R_2 - \frac{p}{2} = (p - g) 2 n^2$$

$$= (15.0 - 4.708) 2 \times 64 = 1317.4$$

$$R_2 = 1324.9; \quad D_2 = 4^\circ 19.5; \quad F = 7^\circ 09' \quad (\text{Table XXII.})$$

$$L = \frac{100 \times 7^\circ 09'}{4^\circ 19'.5} = 165.3 \text{ for straight tracks}$$

$$D_2' = D_2 + D_m$$

$$= 4^\circ 19' + 4^\circ = 8^\circ 19'$$

$$(8^\circ 16' \text{ precise method})$$

$$L = 165.3 \text{ as with straight track}$$

$$(165.5 \text{ precise method}).$$

165. II. When the siding is **inside** the main track.

In a similar fashion it may be shown, using this figure, that

From triangle OFT

$$\tan \frac{1}{2} O = \frac{(p - g)n}{R_m - \frac{p}{2}} \quad (122)$$

From triangle PFS

$$R_2' - \frac{p}{2} = \frac{(p - g)n}{\tan \frac{1}{2} (F - O)} \quad (123)$$

$$L = \frac{100(F - O)}{D_2'} \quad (124)$$

166. III. When the siding is **outside** the main track, but with the center of turnout curve inside of main track.

Let EFS be the outer rail of main track.

FT the inner rail of turnout.

From triangle OFT

$$\tan \frac{1}{2} O = \frac{(p - g)n}{R_m + \frac{p}{2}} \quad (125)$$

From triangle PFS

$$R_2' - \frac{p}{2} = \frac{(p - g)n}{\tan \frac{1}{2} (F + O)} \quad (126)$$

$$L = \frac{100(F + O)}{D_2'} \quad (127)$$

With both § 165 and § 166, approximate results may be reached, by using the "bending method" of p. 93. Where the radius R_2 of the second curve is large and p is small, the approximate method will be sufficiently close; where p is large, the precise method will be necessary. Experience will determine in what cases it will be sufficient to use the approximate results, and where precise formulas should be used.

In a freight yard the tracks on which cars are stored are called "body tracks" and the track which leads to, and connects with, these body tracks is called the "ladder track." The track AD, § 167, is a ladder track.

When the ladder track leaves the main track in a straight line from the theoretical point of frog, if the body tracks are laid parallel to the main track, they may be laid out in straight lines from the theoretical point of the frogs used for the turnouts to these body tracks. With frogs of numbers commonly used in such cases, the distance BC or CD will be sufficient so that there will be plenty of room between the heel of frog and the point of the switch rail following it. For example, the parallel body tracks are seldom less than 12 ft. between centers; with a No. 8 frog and $p = 12$ ft. BC will be 96.4 ft.

The practical lead (Table XXII B) will be 68.0 ft.; from theoretical point to heel of frog will be (Table XXII A) 8.8 ft. Practical considerations involving bending the stock rail demand that the point of switch shall lie fully 4 ft. beyond the rail just at the heel of frog.

It is necessary, therefore, that on a ladder track the distance from the point of one switch to the point of the next switch shall not be less than $67.6 + 8.8 + 4.0 = 80.4$ ft. where a No. 8 frog is used. Since there is 96.4 ft. available and 80.4 ft. only needed, this arrangement of tracks leaves ample room.

If the angle the ladder track makes with the main track be increased, the body tracks are lengthened and the ladder track becomes shorter; both of these results are of value. In the case taken above the angle can be increased until $\sin I = \frac{12}{80.8}$ or $I = 8^\circ 32'$, or in general terms let q = clearance required from heel of frog to next point of next switch, then

$$\sin I \leq \frac{p}{E_t + h + q}$$

It will be necessary also that I shall not exceed the value of AOB in § 167.

The arrangement of a series of body tracks and the ladder tracks allows an opportunity, in many cases, for careful study and much ingenuity; an extended treatment here will not be justified.

168. Problem. *Given for tracks shown in figure the radius R of the curve beyond the heel of frog; also p, p' between parallel tracks; also F, n, g . Required angle AOK and distance $F'F''$.*

Let GK with its center at O be outer rail of the given curve of radius R .

Produce this curve to A when it is parallel to HM .

Let BC with center at P , and ND with center at Q , be similar curves produced.

Let $FG, F'E, F''S$ be straight lines from theoretical point to heel of frogs.

$$OA = R + \frac{g}{2}; \quad BP = NQ = R - \frac{g}{2}; \quad AH = KB = LN = a$$

Find a by (107).

$$OP = R + \frac{g}{2} + a + R - \frac{g}{2} = 2R + a$$

$$\text{Then by (76)} \quad \text{vers } AOK = \frac{p}{2R + a} \quad (129)$$

$$\text{by (128)} \quad KL = \frac{p'}{\sin AOK}$$

$$\text{Since } KF' = LF'' \quad KL = F'F'' = \frac{p'}{\sin AOK} \quad (130)$$

169. Problem. *Given the radial distance between a given curved main track and a parallel siding.*

The two tracks are to be connected by a cross-over, which shall be a reversed curve of given unequal radii beyond the frogs.

Required the central angle of each curve of the reversed curve.

Let AC = center line of inner track.

$$AO = R_m; RP = R_1'; RQ = R_2'$$

R_1' and R_2' are the radii of the curves beyond the frogs and may be assumed as any reasonable values.

Find a_1 and a_2 by applying the "bending process" (p. 93) and then (105) or (107).

Then in the triangle POQ find

$$PO = R_m + R_1' + a_1$$

$$PQ = R_1' + R_2'$$

$$\begin{aligned} OQ &= OC + CB - BQ \\ &= R_m + p - R_2' - a_2 \end{aligned}$$

Solve for OPQ , PQO , POQ , then RQB

In practice this problem might take the following form :

Given R_m , p , g .

Assume n (or F) and n' (or F').

From these values of n and n' compute all data required for a cross-over between straight main tracks. This will involve assuming value of D_1 and D_2 and computing a_1 and a_2 by § 150 or § 151.

The values of a_1 and a_2 may be computed either for the case covered by (105) or by (107).

Then apply the bending process.

This will change the degrees of the turnout curves by the amount of D_m but the lengths of the turnout curves will remain unchanged (approx.) and the distances y_{a1} and y_{a2} obtained by (103) or (106) will also remain unchanged (approx.) as will also the values of a_1 and a_2 .

170. Problem. *Given two main tracks not parallel. Also the unequal frog angles F, F' ; also n, n', h, h', g ; also the unequal radii R_1, R_2 , of reversed curve connecting the two from heel to heel of frogs; also the position of one frog F .*

Required the angles BPS and SOH of the reversed curve; also the position of point B.

$$\text{Let } OH = R_1 + \frac{g}{2}; \quad BP = R_2 + \frac{g}{2}$$

$$HF = h$$

Set transit at theoretical point of given frog F .

Lay off FL perpendicular to TF .

Measure FL , also FLE .

Draw perpendiculars HD, FK, OC .

Let I = angle between main tracks.

Then $FLE = 90^\circ - LFK = 90^\circ - I$.

$$HOC = HOA - COA = F - I.$$

$$DK = h \cos (F - I)$$

$$FK = FL \cos I; \quad LK = FL \sin I$$

$$HD = FK - h \sin (F - I)$$

$$CE = HD + \left(R_1 + \frac{g}{2} \right) \text{vers } (F - I)$$

$$= FL \cos I - h \sin (F - I) + \left(R_1 + \frac{g}{2} \right) \text{vers } (F - I)$$

$$KE = \left(R_1 + \frac{g}{2} \right) \sin (F - I) - h \cos (F - I)$$

CHAPTER IX.

CONNECTING TRACKS AND CROSSINGS.

172. In many cases where a branch leaves a main track, an additional track is laid connecting the two. This is called a "Y" track, and the combination of tracks is called a "Y."

173. Problem. *Given a straight main track HK, also the P.C. and radius R_1 of curve beyond the frog. Also radius R_2 of "Y" track between the frogs. Also select practicable values of F_1, F_2, F_3 .*

Required the distance HK from P.C. of turnout to P.C. of "Y" track; also the central angles of turnout and of "Y" track to the point of junction.

Let HK be the given straight main track.

AB the turnout.

CL the "Y" track.

Draw perpendicular NP.

Let

$$HK = NP = l$$

$$\angle AOB = I_t$$

$$\angle CPL = I_y = 180^\circ - I_t$$

Find $AH = a_1$; $KC = a_2$; $BL = a_3$ by (107) p. 88.

$$\text{Then } \cos \angle AOB = \frac{ON}{OP}$$

$$\cos I_t = \frac{HO - KP}{OB + BL + LP} = \frac{R_1 + a_1 - R_2 - a_2}{R_1 + R_2 + a_3} \quad (132)$$

$$l = (R_1 + R_2 + a_3) \sin I_t \quad (133)$$

174. Problem. Given a straight main track HEK, also the P.C., radius beyond the frog OB, and central angle AOB, of turnout curve connecting with a second tangent BD; also the radius PC of "Y" track. Also select practicable values of F_1, F_2 .

Required the distance HK from P.C. of turnout to P.C. of "Y" track; also distance BD from P.T. of turnout curve to P.T. of "Y" track.

Let HEK be the given main track; ABD the turnout; CL the "Y" track.

Let $AO = R_1$; $CP = R_2$

$HK = AC = l$; $BD = m$

$HA = a_1$; $KC = a_2$

$AOB = I_1$; $DL = a_2$

$CPL = I_2$

Produce DB to E.

Draw parallel AV. Find a_1 and a_2 by (107).

$$\begin{aligned}
 \text{Then } BD &= ED - (VB + EV) \\
 &= KP \tan \frac{1}{2} CPL - \left(AO \tan \frac{1}{2} AOB + \frac{HA}{\sin KEV} \right) \\
 &= (R_2 + a_2) \tan \frac{1}{2} I_2 - \left(R_1 \tan \frac{1}{2} I_1 + \frac{a_1}{\sin I_1} \right) \\
 m &= (R_2 + a_2) \cot \frac{1}{2} I_1 - \left(R_1 \tan \frac{1}{2} I_1 + \frac{a_1}{\sin I_1} \right) \quad (134)
 \end{aligned}$$

$$\begin{aligned}
 \text{also } HK &= EK + EH \\
 l &= (R_2 + a_2) \cot \frac{1}{2} I_1 + \left(R_1 \tan \frac{1}{2} I_1 - \frac{a_1}{\tan I_1} \right) \quad (135)
 \end{aligned}$$

In case different frogs are used near D and K so that KC and DL are not equal, the formulas will be modified.

Let $KC = a_s$ the smaller value

$DL = a_l$ the larger value.

Following the method of § 191, p. 122 :

$$EK = (R_2 + a_s) \cot \frac{1}{2} I_1 + \frac{a_l - a_s}{\sin I_1}$$

$$ED = (R_2 + a_s) \cot \frac{1}{2} I_1 + \frac{a_l - a_s}{\tan I_1}.$$

In finding CK and DL in the foregoing problems of § 173 and § 175 the values of a_2 and a_3 are found from (107) after applying the "bending process."

Example.

If curve AD is a 3° curve and Y track a 7° curve, then the offset $DL = a_3$ will be calculated just as it would be to connect a tangent with a 10° curve ($10^\circ = 7^\circ + 3^\circ$), the same number or angle of frog being used.

Similarly the offset $CK = a_2$ will be the same as that for a tangent and a curve whose degree is the sum of the degrees of curves LK and BC.

176. Problem. *Given the radii, R_1, R_2 , of two curves crossing at C; also the angle at crossing C; also g and g' .*

Required, the frog angles at A, B, D, E; also the lengths on the curves of the rails AB, BE, DE, AD.

Having given $OC = R_1$;
 $OCP = C$; and $PC = R_2$;
 find in triangle OCP, the line OP.

Having given $OA = R_1 - \frac{g}{2}$
 also OP ; and $PA = R_2 - \frac{g'}{2}$
 find in triangle OPA, angles
 APO, AOP , and $OAP = A$.

Having given $OB = R_1 + \frac{g}{2}$
 also OP ; and $PB = R_2 - \frac{g'}{2}$
 find in triangle OPB, angles
 BPO, BOP , and $OBP = B$.

Then $APB = BPO - APO$, and $AB = \left(R_2 - \frac{g'}{2}\right) \text{angle } APB$.

The frog angles at D and E, and the lengths AD, DE, EB, may be calculated in similar fashion.

177. Problem. Given a curve crossing a tangent, R , g , g' , and angle C between tangent and curve.

Required frog angles at A, B, F, D.

Draw AO, BO, CO, FO, DO; also, MO perpendicular to CM.

Then $MO = R \cos C$

$$\cos MOA = \cos A = \frac{MO - \frac{g'}{2}}{R + \frac{g}{2}} \quad (136)$$

$$\cos MOD = \cos D = \frac{MO - \frac{g'}{2}}{R - \frac{g}{2}} \quad (137)$$

$$\cos B = \frac{MO + \frac{g'}{2}}{R + \frac{g}{2}} \quad (138)$$

$$\cos F = \frac{MO + \frac{g'}{2}}{R - \frac{g}{2}} \quad (139)$$

$$DOF = MOD - MOF = D - F$$

The rail length $DF = \left(R - \frac{g}{2}\right) \angle DOF$; and $BF = BL - FL$.

Example. Given $C = 32^\circ 28'$; $D = 8^\circ$ $g = 3$; $g' = 4' 8\frac{1}{2}''$.

Required angle D and distance DF .

$R_8 \log = 2.855385$	$R_8 = 716.78$	$MO = 604.748$
$32^\circ 28' \cos = 9.926190$	$\frac{1}{2} g = 1.50$	$\frac{1}{2} g' = 2.354$
$MO = 604.748 \log = 2.781575$	$OD = OF = 715.28$	602.394
$\frac{1}{2} g' = 2.354$		
$607.102 \log = 2.783261$		$602.394 \log = 2.779881$
$OF = 715.28 \log = 2.854476$		$715.28 \log = 2.854476$
$31^\circ 55' 23'' \cos = 9.928785$		$32^\circ 37' 44'' \cos = 9.925405$
		$31^\circ 55' 23''$
	$DOF = 0^\circ 42' 21''$	
Table XX. $42' = 0.0122173$		
$21'' = 0.0001018$	$2.854476 = \log 715.28 = R - \frac{g}{2}$	
0.0123191	$\log = 8.090579$	
	$0.945055 \log = 8.812 = DF$	

178. When two tracks cross at a small angle, they are often connected by a "slip switch," in which the outer rail lies entirely within the limits of the crossing and is composed of two switch rails and a connecting curve as shown in the figure below.

Problem. *Given for a crossing of two tracks the angle of crossing frog F , also n , b , g ; also clearance m from actual point of frog to point of split switch; also l and t .*

Required, lengths along rail between frog points; also radius R of curve for a slip switch.

Let $DA = QB = l =$ length of switch rail

$HA = LB = t$

$F_1E = F_4Q = m =$ clearance required

Then $bn =$ distance between theoretical and actual points of frogs F_1 and F_4 ; in frogs F_2 and F_3 theoretical and actual points coincide.

$$F_1F_3 = \frac{g}{\sin F} + bn = F_1F_2 = F_3F_4 = F_2F_4$$

In the slip switch, produce the gauge lines DA and QB to V on the line F_2F_3 . Although the point of switch has a thickness ED of about a quarter of an inch, no appreciable error results if DV be calculated assuming DF_2V to be a triangle, in which

$$F_2DV = S; DF_2V = 90^\circ - \frac{F}{2}; F_2D = F_1F_2 - m$$

Then

$$AV = DV - l$$

$$R + \frac{g}{2} = \frac{AV}{\tan \frac{1}{2}(F - 2S)}$$

Middle ordinate for chord $AB = \left(R + \frac{g}{2}\right) \text{vers } \frac{1}{2}(F - 2S)$

$$\text{Arc } AB = \left(R + \frac{g}{2}\right) \text{ angle } (F - 2S)$$

179. Problem. *Given two main tracks crossing at a given angle I ; the radius R of curve connecting the two, and extending from heel of frog to heel of equal frog.*

Required the distances $VF = VF'$ between actual points of frogs.

Produce given curve to I and J where it is parallel to given main tracks.

Find by (107) $a = a'$.

$$OC = R + a - \frac{g}{2}$$

$$CV = \left(R + a - \frac{g}{2} \right) \tan \frac{1}{2} I$$

$$CF = y_a \quad \text{from (106)}$$

$$VF = CV - CF = VF'$$

If the angle at V is at all sharp, allowance should be made for the difference between the theoretical and actual point of the frog at V.

180. Problem. *Given a straight main track VB and the straight line AV of a branch track, intersecting it at a given point V, and at a given angle I ; also radius R of turnout curve to connect branch line and heel of frog; also F , n , h , b , g .*

Required in figure, VA, VB; also position of point of frog.

Find a by (107).

$$AV = AV' + VV'$$

$$= R \tan \frac{1}{2} I + \frac{a}{\sin I}$$

$$VB = R \tan \frac{1}{2} I - \frac{a}{\tan I}$$

Find F from B by fieldwork or computation, using (106).

181. Problem. Given a curved main track IB of radius R_m a straight branch track AI intersecting at a given angle I ; also radius R_t of turnout curve from heel of frog to branch line; also F, n, h, b, g .

Required in the figure, IA, IOB

Let O be the center of curve of main line

P be the center of curve of turnout

Draw perpendiculars PA, OC, PK

Find a by (107)

$$IOC = I$$

$$OC = R_m \cos I; \quad IC = R_m \sin I$$

$$OP = R_m \pm (R_t + a)$$

$$KO = OC \pm R_t$$

$$\frac{KO}{OP} = \cos KOP; \quad KP = OP \sin KOP$$

$$IA = IC - KP; \text{ or } = KP - IC; \quad IOB = KOB - I \text{ or } = I - KOB$$

IOB determines position of B

Find position of frog point by (106)

182. Problem. *Given a straight main track IBC and a curved branch track of radius R_b intersecting at an angle I ; also radius R_t of turnout curve from heel of frog to branch line; also F, n, h, b, g .*

Required in the figure, IB, IOA

Let O be the center of curve of branch line

P be the center of curve of turnout

Draw perpendiculars PB, OC, PK

Find a by (107)

$$IOC = I$$

$$OC = R_b \cos I; IC = R_b \sin I$$

$$OP = R_b - R_t$$

In Figure 1

$$KO = OC - (R_t + a)$$

$$\frac{KO}{OP} = \cos POK; PK = OP \sin POK$$

$$IB = IC - PK; IOA = POK - I$$

In Figure 2

$$PK = (R_t + a) - OC$$

$$\frac{PK}{OP} = \sin POK; KO = OP \cos POK$$

$$IB = IC - KO; IOA = POK + 90^\circ - I$$

Other cases will occur requiring figures different from those shown here · some of them will be suggested by the figures in § 181.

183. Problem. *Given a straight track and a curved track of radius R_m intersecting at a given angle I ; also radius R_t of turnout curve from heel of frog to heel of frog; also F, n, h, b, g . Required in the figure, IOA, IB*

Let O be the center of curve of main track

P be the center of curve of turnout

Draw perpendiculars PB, OC, OK, or PK

Find a_1 and a_2 at A and B by (107)

$$IOC = I$$

$$OC = R_m \cos I; IC = R_m \sin I$$

$$OP = R_m - (R_t + a_1)$$

In Figure 1

$$PK = R_t + a_2 - OC$$

$$\frac{PK}{OP} = \sin POK; KO = OP \cos POK$$

$$IB = IC - KO; IOA = POK + 90^\circ - I$$

In Figure 2

$$KO = OC - (R_t + a_2)$$

$$\frac{KO}{OP} = \cos POK; PK = OP \sin POK$$

$$IB = IC - PK; IOA = POK - I$$

Other cases will occur requiring figures different from those shown here; some of them will be suggested by the figures in § 181.

- 184. Problem.** *Given two curved lines of track of radii R_1 R_2 crossing each other, intersecting at an angle I ; also the radius R_t of turnout from heel to heel of frog; also F, n, h, b, g . Required in the figure, API, IOB*

Let O and P be centers of main tracks

Q be center of turnout

$$OIP = I$$

Find a_1 at A, and a_2 at B by (107)

In triangle IOP, $IO = R_2$;

$$IP = R_1$$

$$OIP = I$$

Solve for OP, $\angle IOP$, $\angle IPO$

In triangle OQP, $QP = R_t - (R_t + a_1)$

$$QO = R_2 + (R_t + a_2)$$

OP computed

Solve for QOP, QPO, OQP

From QPO and IPO, find API

From IOP and QOP, find IOB.

CHAPTER X.

SPIRAL EASEMENT CURVE.

185. Upon tangent, track ought properly to be level across; upon circular curves, the outer rail should be elevated in accordance with the formula

$$e = \frac{gv^2}{32.2 R}$$

in which

e = elevation in feet

g = gauge of track

v = velocity in feet per second

R = radius of curve in feet

In passing around a curve, the centrifugal force $c = \frac{Wv^2}{32.2 R}$

It is desirable for railroad trains that the centrifugal force should be neutralized by an equal and opposite force, and for this purpose, the outer rail of track is elevated above the inner. Any pair of wheels, therefore, rests upon an incline, and the weight W resting on this incline may be resolved into two components, one perpendicular to the incline, the other parallel to the incline, and towards the center of the curve.

The component p parallel to the incline will be $p = \frac{We}{g}$

It will be a very close approximation to assume that c acts parallel to the incline (instead of horizontally). The centrifugal force will be balanced (approx.) if we make

$$p = c \text{ or } \frac{We}{g} = \frac{Wv^2}{32.2 R}$$

whence

$$e = \frac{gv^2}{32.2 R} \quad (140)$$

In passing directly from tangent to circular curve, there is a point (at *P.C.*) where two requirements conflict; the track cannot be level across and at the same time have the outer rail elevated. It has been the custom to elevate the outer rail on the tangent for perhaps 100 feet back from the *P.C.* This is unsatisfactory. It has therefore become the best practice to introduce a curve of varying radius, in order to allow the train to pass gradually from the tangent to the circular curve.

186. The transition will be most satisfactorily accomplished when the elevation *e* increases uniformly with the distance *l* from the *T.S.* (point of spiral) where the spiral easement curve leaves the tangent; then $\frac{e}{l}$ is a constant

$$\text{or } \frac{gv^2}{32.2 Rl} = A \text{ (a constant) or } Rl = \frac{gv^2}{32.2 A}$$

Since *g*, *v*, *A* are constants, $Rl = C$ (a constant)

$$\text{Then } Rl = R_c l_c \text{ and } R = \frac{R_c l_c}{l} \quad (141)$$

$$\text{also } \frac{l}{D} = \frac{l_c}{D_c} \text{ or } \frac{D}{D_c} = \frac{l}{l_c} \text{ (approx.)} \quad (141 A)$$

where R_c = radius of circle

D_c = degree of circular curve

l_c = total length of spiral in feet.

Let *s* = the "Spiral Angle" or total inclination of curve to tangent at any point.

s_c = spiral angle where spiral joins circle.

$$\text{Then } Rds = dl \text{ or } ds = \frac{dl}{R}$$

$$\begin{aligned} \text{from (141)} \quad &= \frac{ldl}{R_c l_c} \\ &s = \frac{l^2}{2 R_c l_c} \quad (142) \end{aligned}$$

$$\text{Again } dx = dl \sin s \quad \text{and} \quad dy = dl \cos s$$

All values of s will generally be small, and we may assume

$$\sin s = s \quad \text{and} \quad \cos s = 1$$

$$\text{then} \quad dx = sdl \quad dy = dl$$

$$= \frac{l^2 dl}{2 R_c l_c} = \frac{y^2 dy}{2 R_c l_c} \quad y = l$$

$$\text{Integrating, } x = \frac{y^3}{6 R_c l_c} \quad (143)$$

which is the equation of the "Cubic Parabola," a curve frequently used as an easement curve.

If, however, the approximation $\cos s = 1$ be not used, the resulting curve will be more nearly correct than is the Cubic Parabola. In this case

$$\sin s = s$$

$$dx = sdl = \frac{l^2 dl}{2 R_c l_c}$$

$$\text{Integrating, } x = \frac{l^3}{6 R_c l_c} \quad (144)$$

The resulting curve we may call, for the lack of a better name, the "Cubic Spiral" Easement Curve.

The Cubic Parabola is well adapted to laying out curves by "offsets from the tangent." Modern railroad practice favors "deflection angles" as the method of work wherever practicable. In the case of an easement curve the longitudinal measurements are most conveniently made as chords along the curve,

so that $x = \frac{l^3}{6 R_c l_c}$ represents a curve more convenient for use

than is $x = \frac{y^3}{6 R_c l_c}$ as well as more nearly correct. Evidently the properties of the two curves will be very similar.

The following notation in connection with spirals has been adopted by the Am. Ry. Eng. Ass'n. For the point of change

from tangent to spiral, *T.S.*

from spiral to circular curve, *S.C.*

from circular curve to spiral, *C.S.*

from spiral to tangent, *S.T.*

This notation will be adopted here.

It will be observed that the Cubic Spiral has the following properties (some slightly approximate):

(a) The degree of curve varies directly with the length from the *T.S.* (141 A)

(b) The deflection angles vary as the squares of the lengths from the *T.S.* (146 A)

(c) The offsets from the tangent vary as the cubes of the lengths from the *T.S.* (144)

(d) The "spiral angle" at the point where the spiral joins the circular curve is equal to the central angle of a circular curve of the same degree and of a length one-half that of the spiral. (145)

(e) The deflection angle to any point on the spiral is one-third the spiral angle at that point. (146)

188. *Given* l, l_c, R_c . *Required* y and y_c .

From (30) the excess of hypotenuse over base

$$e = c - a = \frac{h^2}{2c}$$

Then in the Cubic Spiral, at any point on the spiral, let the excess

$$de = dl - dy$$

from (30)
$$de = \frac{dx^2}{2 dl} = \frac{l^4 dl^2}{2 \times 4 R_c^2 l_c^2 dl} = \frac{l^4 dl}{8 R_c^2 l_c^2}$$

integrating,
$$e = l - y = \frac{l^5}{40 R_c^2 l_c^2}$$

$$y = l - \frac{l^5}{40 R_c^2 l_c^2} \quad (147)$$

$$y_c = l_c - \frac{l_c^5}{40 R_c^2 l_c^2} = l_c - \frac{l_c^3}{40 R_c^2} \quad (147 A)$$

189. *Given* R_c, y_c, x_c, s_c . *Required* $AL = q$ and $LK = p$.

$$CN = x_c \text{ and } AN = y_c$$

$$AL = AN - OC \sin COK \quad \text{or} \quad q = y_c - R_c \sin s_c \quad (148)$$

$$LK = CN - OC \text{ vers } COK \quad p = x_c - R_c \text{ vers } s_c \quad (148 A)$$

Tables have been computed for the Cubic Spiral described above. These have been abandoned in favor of the spiral adopted by the Am. Ry. Eng. Ass'n, and new tables arranged for this spiral which is described in the following section.

190. In the Cubic Spiral, the lengths have been considered as measured along the curve itself; but measurements in the field are necessarily taken by chords. This is recognized in defining the degree of a simple curve § 39 as the angle at the center subtended by a *chord* of 100 ft. Consistent with this, in the Am. Ry. Eng. Ass'n Spiral, the length of spiral is measured by *ten equal chords*, so that the theoretical curve is brought into harmony with field practice. This spiral will be referred to here as the A. R. E. A. Spiral, and adopted in place of the Cubic Spiral. The two curves substantially coincide up to the point where $s_c = 15^\circ$, and the discussion of the Cubic Spiral applies in a general way to the A. R. E. A. Spiral also. Beyond $s_c = 15^\circ$ the A. R. E. A. Spiral has its tables computed substantially without approximations, making it a very perfect and convenient transition curve even for sharp curves on street railways.

The A. R. E. A. Spiral retains the following features characteristic of the Cubic Spiral:

(a) The degree of curve varies directly with the length from the *T.S.*

$$\frac{D}{D_c} = \frac{l}{l_c} \quad (141 A)$$

(b) The deflection angles vary as the squares of the lengths from the *T.S.*

$$\frac{i}{i_c} = \left(\frac{l}{l_c} \right)^2 \quad (146 A)$$

(d) The spiral angle at the point where the spiral joins the circular curve is equal to the central angle of a circular curve of the same degree and of a length one-half that of the spiral.

$$s_c = \frac{l_c D_c}{200} \quad (145 A)$$

(e) For practical purposes the deflection angle to any point on the spiral is one-third the spiral angle at that point (up to a value of $s_c = 15^\circ$),

or
$$i = \frac{s}{3} \quad (146)$$

Beyond 15° and up to 45° for values of s_c , correct values have been computed by the Am. Ry. Eng. Ass'n and the following empirical formula is found to apply:

$$i = \frac{s}{3} - 0.00297 s^3 (\text{seconds})$$

With the A.R.E.A. Spiral, the angle made with the tangent at the *T.S.* by the first chord is taken as

$$\alpha_1 = \frac{s_c}{300}$$

No appreciable error is found to result if the angles made by successive chords with this tangent are taken as exact multiples of α_1 as follows:

$$1, 7, 19, 37, 61, 91, 127, 169, 217, 271$$

It is evident that these values of α_1, α_2 , etc. depend upon s_c and are independent of the length of chord used.

For computing values of x_c, y_c the method of "offsets from the tangent" § 66 is adopted and co-ordinates x, y , at each chord point are found by using

$$\frac{l_c}{10} \sin \alpha_1, \frac{l_c}{10} \cos \alpha_1; \frac{l_c}{10} \sin \alpha_2, \frac{l_c}{10} \cos \alpha_2, \text{ etc.}$$

For a given value of s_c the final co-ordinates $x_c y_c$ will be directly proportional to l_c , so that $\frac{x_c}{l_c} \cdot \frac{y_c}{l_c}$ will be constants of a given value of s_c . It will be true of the long chord *C* from *T.S.* to *S.C.* that $\frac{C}{l_c}$ will also be a constant.

A condensed table of values of $\frac{x_c}{l_c}, \frac{y_c}{l_c}, \frac{C}{l_c}$ is given in Table VII, B; for values of s_c differing by $0^\circ 30'$.

This table will have occasional rather than frequent use; intermediate values may be interpolated with sufficient precision for ordinary cases; the labor of interpolating will not be burdensome.

From these values of x_c and y_c , determined as above, values of i_c have been computed for successive values of s_c up to 45° and these are tabulated in Table VII. All of the computations mentioned above have been made by the Am. Ry. Eng. Ass'n.

For convenient use in the field the deflection angle to each chord point is necessary, and the author has computed these for successive values of s_c and tabulated them in Table VII.

The deflection angles are constant for a given value of s_c and may be used for this value of s_c whatever the length of spiral, provided the chord length is made one-tenth the length of spiral.

Example. Given a line as shown in sketch.

Required to connect the tangents by a 4° curve with a spiral 180 feet long at each end.

Find T_c Table III. $22^\circ 14'$ $T_1 = \frac{1125.8(4^\circ)}{281.45}$

Table IV. $.05$ corr.

Table VI. $p = 0.94$; $q = 89.97$ $281.50 = T_c$

$\text{nat tan } \frac{1}{2}(22^\circ 14') = 0.19649$

$89.97 = q$

$0.19649 \times 0.94 = 0.18$

$.18 = p \tan \frac{1}{2} I$

$371.65 = T_s$

$s_c = 3^\circ 36'$

$V = 46 + 72.7$

$2 s_c = 7^\circ 12'$

$3 + 71.7 = T_s$

$I = 22^\circ 14'$

$T.S. 43 + 01.0$

$I - 2 s_c = 15^\circ 02'$

$1 + 80.0 = l_c$

$L = \frac{4^\circ 15.0333}{375.8}$

$S.C. 44 + 81.0$

$3 + 75.8 = L$

Table VI. $s_c = 3^\circ 36' = 3^\circ.6$

$C.S. 48 + 56.8$

Deflection angles for spiral from

$1 + 80.0 = l_c$

Table VII. for $s_c = 3^\circ.6$

$S.T. 50 + 36.8$

Transit at $43 + 01.0 T.S.$

Defl. angles for circular curve

$i = 0^\circ 01'$ to $43 + 19.0$

with transit at $44 + 81.0$

$0^\circ 03'$ $43 + 37.0$

$s_c = 3^\circ 36'$

$0^\circ 06'$ $43 + 55.0$

$i_c = 1^\circ 12'$

$0^\circ 11'$ $43 + 73.0$

back deflection to $T.S. = 2^\circ 24'$

$0^\circ 18'$ $43 + 91.0$

for $c_i = 19$, $\frac{d_i}{2} = 0^\circ 23' 45$

$0^\circ 26'$ $44 + 09.0$

$2^\circ 23' 46$

$0^\circ 35'$ $44 + 27.0$

$4^\circ 23' 47$

$0^\circ 46'$ $44 + 45.0$

$6^\circ 23' 48$

$0^\circ 58'$ $44 + 63.0$

$1^\circ 12'$ $44 + 81.0$

for $c_f = 56.8$, $\frac{d_f}{2} = \frac{1^\circ 08'}{7^\circ 31'} 48 + 56.8$

$\frac{I - 2 s_c}{2} = \frac{15^\circ 02'}{2} = 7^\circ 31' \text{ Check}$

192. Problem. Given D_c and l_c .

Required p , q , and other data for spiral

$$\text{from (145 A) } s_c = \frac{l_c D_c}{200} \quad (145 A)$$

The Am. Ry. Eng. Ass'n uses the following empirical formulas for values of p and q ,

$$p = al_c - bD_c \quad q = el_c - fD_c.$$

Tables of the coefficients a , b , e , f , condensed from the A. R. E. A. Tables are given in Table VII B for values of s_c differing by 30'; intermediate values may be interpolated.

The deflection angles may be found as before from Table VII.

193. Problem. Given D_c and p .

Required to lay out spiral.

$$\text{from (145) } KC = \frac{l_c}{2} \text{ (approx.),}$$

$$\text{from (145 B) } q = \frac{l_c}{2} \text{ (approx.)}$$

$$CN = x_c = \frac{l_c^3}{6 R_c l_c} = \frac{l_c^2}{6 R_c} \quad \text{for spiral}$$

$$\text{from (26) } CQ = \frac{c^2}{2 R_c} = \frac{\left(\frac{l_c}{2}\right)^2}{2 R_c} = \frac{l_c^2}{8 R_c} \text{ (approx.) for circle}$$

$$\text{therefore } CN = \frac{4}{3} CQ = CQ + \frac{CQ}{3} = CQ + QN \text{ (approx.)}$$

$$CQ = 3 QN = 3 KL = 3 p \text{ (approx.)}$$

$$CN = 4 QN = 4 KL \text{ (approx.)}$$

$$\text{from (144) } \frac{x}{x_c} = \frac{l^3}{l_c^3} \quad (149 C)$$

$$CN = 2^3 TL = 8 TL = 4 KL$$

$$TL = \frac{KL}{2} = \frac{p}{2} \text{ (approx.)} \quad (149 D)$$

From $CQ = 3p$ the length of curve may be readily determined. If the center of the circular curve KC be at O, then

$$KOC = CFN = s_c$$

$$\text{vers } KOC = \frac{CQ}{OK} \text{ or } \text{vers } s_c = \frac{3p}{R_c}$$

$$\frac{100 s_c}{D_c} = L \text{ for circular curve KC ; } l_c = 2L$$

$$\text{from (146) } i_c = \frac{s_c}{3} ; \text{ for other deflections } i = i_c \left(\frac{l}{l_c} \right)^2 \quad (146 A)$$

The back deflection $ACF = 2 i_c$.

By the above method, the values of s_c and l_c may be reached with substantial accuracy without the use of the spiral tables. Where close results are necessary, p may be re-computed by Table VII B from the values of s_c and l_c already found by the above formulas. If the new value of p is not sufficiently close to the given value, correct values of s_c and l_c may be found by trial. The value of q is found by Table VII B.

The deflection angles may then be taken from Table VII.

It will be understood that the method of § 193 is more laborious than the more common method of § 191 ; its value lies in the fact that it is thoroughly elastic and any given length of spiral may be used. In a similar way, if the value of p (together with D_c) determines the spiral to be used, the method of § 193 becomes useful.

Approximate Method.

Problem. Given D_c and either l_c or p .

Required s_c and the deflection angles without the use of tables.

Assume the long chord KC to be equal to $\frac{l_c}{2}$.

$$R_1 = 5730 \quad R_a = \frac{5730}{D_a}$$

By § 198 find $3p$ from R_c and L by (26) or find L from R_c and $3p$ by (26)

$$L = q \text{ (approx.) ; } s_c = \frac{l_c D_c}{200} ; \text{ and } i = \frac{s_c}{3}$$

$$\text{Other deflections are found by } i = i_c \left(\frac{l}{l_c} \right)^2 \quad (146 A)$$

194. Fieldwork of Laying out Spiral.

(a) Select on the ground the vertex V and measure I ; or else fix on ground, point L opposite the point K where the circular curve will become parallel to tangent.

(b) Select the length l_c of spiral to join given circular curve; this may be taken from Table VI or computed by § 193 from D_c and p .

(c) Find value of q and s_c from Table VI or by § 193.

(d) Set $T.S.$ at A by measuring T_s from vertex, or by measuring q from point L , as the case may be.

(e) With transit at $T.S.$ run in spiral using deflection angles from Table VII.

(f) With transit at $S.C.$ turn vernier to 0° and beyond 0° to measure angle $s_c - i_c$ (this will be $2 i_c$ when s_c is less than 15°).

(g) Take backsight on $T.S.$, and when vernier reads 0° the line of sight is on auxiliary tangent.

(h) Run in circular curve by deflection angles; the central angle of circular curve = $I - 2 s_c$.

(i) With transit at $S.T.$ (not at $C.S.$) run in second spiral.

(k) "Check" on $C.S.$

(l) If the "check" is not substantially perfect, re-set the point at $C.S.$

It is important that each spiral shall be correct throughout its entire length. In case the spiral and circular curve do not check properly at the $C.S.$, the discrepancy should be thrown into the circular curve where its effect will be unimportant.

When the circular curve is visible from the $C.S.$ the general method of § 62 will give the best results, as follows:

(A) Lay out first spiral from $T.S.$ to $S.C.$

(B) Lay out second spiral from $S.T.$ to $C.S.$

(C) Set up transit at $C.S.$ and lay out circular curve from $S.C.$ to $C.S.$ and check angle to $S.T.$

195. Given D_c and l_c .

Required to lay out spiral by offsets from the tangent.

From Table VI find value of x_c .

Find other values of x at convenient intervals by formula

$$x = x_c \left(\frac{l}{l_c} \right)^3 \quad (\text{from 144})$$

This method will be useful at times but more often spirals will be laid out by deflection distances.

Example. Given $D_c = 4^\circ$, $l_c = 240$.

Required offsets from tangent to spiral.

Take offsets at middle, quarter, and eighth points.

Table VI gives :

for	$l_c = 240$	$x_c = 6.70$
at	$l_4 = 120$	$x_4 = 6.70 \div 8 = 0.8375$
	$l_2 = 60$	$x_2 = 0.8375 \div 8 = 0.1047$
	$l_1 = 30$	$x_1 = 0.1047 \div 8 = 0.0131$
	$l_3 = 90$	$x_3 = 0.0131 \times 3^3 = 0.35$
	$l_5 = 150$	$x_5 = 0.0131 \times 5^3 = 1.64$
	$l_6 = 180$	$x_6 = 0.0131 \times 6^3 = 2.83$
	$l_7 = 210$	$x_7 = 0.0131 \times 7^3 = 4.49$

The "cubic spiral" will be laid out by measuring successive chords of 30 ft. each, and measuring the proper offset from the tangent.

For the "Cubic Parabola,"

the formula is
$$x = \frac{y^3}{6 C}$$

whence
$$x = x_c \left(\frac{y}{y_c} \right)^3$$

The computations may be the same as for the cubic spiral. The successive distances of 30 will be laid off on the tangent and the offset laid off at right angles to the tangent.

196. It may occasionally (although not frequently) happen that the entire spiral cannot be laid out from the *T.S.*, and it will be necessary to determine deflection angles when the transit is at some intermediate point on the spiral. It will be desirable to occupy some regular chord point.

In any Cubic Spiral, the degree of curve *D* increases uniformly with the length (141 *A*). Hence the degree of curve at 1 must be equal to the difference in degree between the circular curve and the spiral at 5 where length $A1 = C5$.

Since the divergence in the degree of the spiral is the same for a given distance, whether this divergence be from the tangent *AL* or from the curve *CK*, it will naturally follow from the principles established in § 69, that the offset to the spiral for a given distance from *C* will be the same as the offset for the same distance from *A*, since the change in degree at corresponding points is always the same whether from tangent or curve.

The same conclusion will be reached by referring to § 160 near the bottom of p. 93, where the elastic model and the "bending process" is referred to; this bending process being there found to be correct (approx.) from the demonstration § 158, p. 92. If this principle be correct, it will follow that $KT = TL$, which may be considered an extreme case. That $KT = TL$ is demonstrated (in 149 *D*) to be correct is an additional assurance of the correctness of the principle stated above.

It will further follow if $E1$ and $D5$ are equal, and at equal distances from *A* and *C* respectively, that the angles $E1A$ and $D5C$ will be equal (closely). For the offset divided by the distance gives approximately the sine of the angle, and since the sines are equal, the angles also are equal; similarly the angles LAT and KCT are equal.

In other words, the divergence of any given spiral for a given distance, is the same either in offset or in angle, whether the divergence be from the tangent or from the circular curve.

197. It will therefore follow that if at any point B on the spiral ABC, the transit be set up and the line of sight be brought

on the auxiliary tangent BG at that point, then the deflection angle to any forward point on the spiral will be the sum of (1) the "total deflection angle," for the distance from B to that point, due to the circular curve HBJ, whose degree is the degree of the spiral at B; and (2) the "total deflection angle" from the original tangent for that spiral for the same distance reckoned from the *T.S.* For any back point, the deflection angle from this auxiliary tangent will be the difference between these angles.

The proper use of these deflection angles will allow the line of sight to be brought on the auxiliary tangent, as well as give means for setting all points on the spiral.

Example. Required forward deflection angles from point 6 on a spiral 300 feet long, to join 5° curve.

$$s_c = 7^\circ 30' = 7^\circ.5$$

The tangent BG is found by laying off from chord AB, twice the forward deflection to point 6, or $2 \times 54' = 1^\circ 48'$.

$$D \text{ at point 6} = 0.6 \times 5^\circ = 3^\circ 00'$$

$$\text{Deflection angle for 30 ft. on } 3^\circ \text{ curve} = 27'$$

$$\text{The total angles will be at point 7, } 27' + 01' = 28'$$

$$8, 54' + 06' = 1^\circ 00'$$

$$9, 81' + 13' = 1^\circ 34'$$

$$10, 108' + 24' = 2^\circ 12'$$

$$\text{The back deflections will be at point 5, } 27' - 01' = 26'$$

$$4, 54' - 06' = 48'$$

$$3, 81' - 13' = 1^\circ 08'$$

$$2, 108' - 24' = 1^\circ 24'$$

$$1, 135' - 37' = 1^\circ 38'$$

$$0, 162' - 54' = 1^\circ 48'$$

The back deflection from point 6 to *T.S.* also $= 0^\circ 54' \times 2 = 1^\circ 48'$.

198. The method of determining the angle between the tangent and any chord of the spiral may now be readily understood, and is described in the Proceedings of the Am. Ry. Eng. Ass'n as follows :

"Dividing the spiral into ten equal parts, the angle between the tangent at the *T.S.* and the chord from a spiral ($n - 1$) to the point (n) is the central angle of the spiral from the *T.S.* to the point ($n - 1$), plus the degree of curve at the point ($n - 1$) times half the distance in stations from ($n - 1$) to (n), plus the deflection from the tangent at the *T.S.* to the chord subtending the first tenth of the spiral"

$$\begin{aligned}\text{or,} \quad \alpha_n &= \left(\frac{n-1}{10} \right)^2 s_c + \frac{n-1}{100} s_c + \frac{s_c}{300} \\ &= \frac{3n^2 - 3n + 1}{300} s_c\end{aligned}$$

"Substituting the successive numerals 1 to 10 for n , the successive values" of α "are 1, 7, 19, 37, 61, 91, 127, 169, 217, and 271 — 300ths" of s_c .

In a similar fashion the Am. Ry. Eng. Ass'n has calculated the forward and backward deflections when the transit is at an intermediate station on the spiral and Table VII *A* shows these as multiples (by full numbers) of the first chord deflection angle i_1 .

In finding the numbers for this Table the assumption was made that the deflection angle from the *T.S.* to any point is one third the spiral angle to that point, which is approximate only where s_c exceeds 15° . When the transit is set at a point P' and a deflection angle (from the auxiliary tangent at P') is taken to another point P'' the Am. Ry. Eng. Ass'n states :

"The formulas and rule are approximate and should not be used when the central angle from P' to P'' exceeds the central angle from the *T.S.* by more than 15° ."

Table VII *A* furnishes a very simple method of finding forward and back deflections when it becomes necessary to set the transit at an intermediate point on the spiral. While multiplying i_1 may be somewhat burdensome, setting up at intermediate points will not be frequent, and simplicity is of prime importance.

199. Compound Curves. In the case of Compound Curves, it is proper and desirable that easement curves should be introduced between the two circular curves forming the compound curve.

Problem. *Given in a Compound Curve, D_t , D_s , p , or l .*

Required the Deflection Angles for a Cubic Spiral to connect the circular curves.

(a) Find by Table VII or by § 193 the Deflection Angles proper for a Cubic Spiral to connect a tangent with a circular curve of degree = $D_t - D_s$.

Let these = i_1 , i_2 , i_3 , etc.

(b) Find the deflection angles to corresponding points on one of the circular curves, the auxiliary tangent for these being at the point where the Cubic Spiral leaves this circular curve (where the transit will be set).

Let these = $\frac{d_1}{2}$, $\frac{d_2}{2}$, $\frac{d_3}{2}$, etc.

(c) The required total deflections from A will be for

point 1	$\frac{d_1}{2} + i_1$	point 2	$\frac{d_2}{2} + i_2$
point 3	$\frac{d_3}{2} + i_3$ etc.		

The required total deflections from C will be for

point 1	$\frac{d'_1}{2} - i_1$	point 2	$\frac{d'_2}{2} - i_2$ etc.
---------	------------------------	---------	-----------------------------

Similar procedure may be followed if it be desired to lay out the spiral by offsets. Convenient points may be set on the circular curves and the offsets taken from either curve.

Example. Given $D_1 = 4^\circ$, $D_s = 7^\circ$, $l_c = 200$.

From Tables VI and VII find deflection angles for a curve of $D = 7^\circ - 4^\circ = 3^\circ$ with $l_c = 200$, where $s_c = 3^\circ 00'$. On 4° circular curve deflection angle for 20' chord = $0^\circ 24'$.

	4° curve deflection + spiral deflection	
for point	1	$0^\circ 24' + 0^\circ 01' = 0^\circ 25'$
	2	$0^\circ 48' + 02' = 0^\circ 50'$
	3	$1^\circ 12' + 05' = 1^\circ 17'$
	4	$1^\circ 36' + 10' = 1^\circ 46'$
	5	$2^\circ 00' + 15' = 2^\circ 15'$
	6	$2^\circ 24' + 22' = 2^\circ 46'$
	7	$2^\circ 48' + 29' = 3^\circ 17'$
	8	$3^\circ 12' + 38' = 3^\circ 50'$
	9	$3^\circ 36' + 49' = 4^\circ 25'$
	10	$4^\circ 00' + 60' = 5^\circ 00'$

These are total deflection angles from auxiliary tangent when the transit is on the 4° curve.

Field work.

(a) Fix L or K in ground from topography or other practical requirements, the same as for any compound curve.

(b) Assume l_c and compute p .

(c) Fix A and C, true transit points on curve, at distances $\frac{l_c}{2}$ from L or K.

(d) Set transit at A.

(e) Bring line of sight on auxiliary tangent at A.

(f) Set off "total deflection" angles to spiral and run in spiral.

200. Determination of Length of Spiral.

The basis used by the Am. Ry. Eng. Ass'n for fixing the proper length of spiral is the increase per second of the elevation of the outer rail. Too rapid an increase, it is thought, will cause some discomfort to passengers. The discussion is too extended for a pocket book, and will not be attempted here.

The Am. Ry. Eng. Ass'n has prepared a diagram shown as Table VII C which covers the recommendation of the Association for fixing the length of spirals.

201. Problem. *Given two simple curves with connecting tangent.*

Required to substitute a simple curve of given radius with connecting spirals at each end.

Let $DC = t =$ given tangent, connecting the two curves AD and CB of radii R_s and R_l respectively.

Let GT be the given new curve of radius R_c .

Assume suitable spirals and find from table VI, $GE = p_1$ and $ST = p_2$ for these spirals, also q_1 and q_2 .

Join OP and draw perpendicular OL .

$$\text{Then } \tan \text{ LOP} = \frac{R_l - R_s}{t}; \quad OP = \frac{t}{\cos \text{ LOP}}$$

In the triangle OPQ there are given

$$OP = \frac{t}{\cos \text{ LOP}}; \quad OQ = R_c - R_s - p_1; \quad QP = R_c - R_l - p_2$$

Solve this triangle for QOP , QOP , OPQ .

$$\text{Then } \text{CPS} = 180^\circ - (\text{OPQ} + \text{OPL})$$

$$\text{EOD} = 90^\circ - (\text{QOP} + \text{LOP})$$

Knowing the stations of D and C , the stations of E and S are readily found and also the stations of the *C.S.* and *S.C.* by applying q_1 and q_2 .

203. It may sometimes seem more desirable to change the radius of the circular curve so as to keep the new alignment in such position as to show as little deviation as possible from the old alignment and at the same time keep the length of line as nearly as possible unchanged. This may be accomplished as indicated in the figure below, where the line is carried outwards at B and inwards near D and L.

Problem. Given I and R_1 for circular curve DB; also p of spiral; also $BH = h$ measured along VO locating H through which new circular curve is to pass to allow the use of this spiral.

Required the radius $R_2 = KP$ of the new curve KH; also q consistent with p and R_2 ; also distance $DA = d$ from P.C. to T.S.

$$PO = NO = OB + BH - PH$$

$$= R_1 + h - R_2$$

$$OM = DO - DM$$

$$= DO - PK - KL$$

$$= R_1 - R_2 - p$$

$$NM = NO - OM = h + p$$

$$PO \text{ vers } NOP = NM$$

$$(R_1 - R_2 + h) \text{ vers } \frac{1}{2} I = h + p$$

$$R_1 - R_2 + h = \frac{h + p}{\text{vers } \frac{1}{2} I} \quad (151)$$

Find q from p and R_2 , by § 193.

Then

$$DA = AL - DL$$

$$= AL - MP$$

$$d = q - (R_1 - R_2 + h) \sin \frac{1}{2} I. \quad (151 A)$$

204. When it is necessary to keep the middle point H unchanged, on account of a bridge, or heavy embankment, or otherwise, it then becomes necessary to make part of the curve sharper, as CF in the figure below. The most practical method appears to be to assume the angle FOH , the part of the curve to remain unchanged; also assume the value of p and compute all other necessary data.

Problem. Given I and R_1 of circular curve, also p of proposed spiral, also angle $FOH = I_1$ of the circular curve which is to remain unchanged.

Required the radius R_2 of new curve CF , to compound with original curve FH ; also q consistent with p and R_2 ; also the distance $DA = d$ from P.C. to T.S.

$$FOH = I_1$$

$$DOH = \frac{1}{2} I$$

$$OP \text{ vers } NOP = NM = MD - ND$$

$$= LP - KP = p$$

$$(R_1 - R_2) \text{ vers } (\frac{1}{2} I - I_1) = p$$

$$R_1 - R_2 = \frac{p}{\text{vers } (\frac{1}{2} I - I_1)} \quad (152)$$

Find q from p and R_2 by § 193.

Then

$$DA = AL - DL$$

$$= AL - MP$$

$$d = q - (R_1 - R_2) \sin (\frac{1}{2} I - I_1) \quad (152 A)$$

By making $FOH = I_1 = 0$, R_2 becomes continuous from the first spiral, through H and to its connection with the second spiral.

Another practical method would be to assume R_2 and p and compute I_1 , q , d .

CHAPTER XI.

SETTING STAKES FOR EARTHWORK.

205. The first step in connection with Earthwork is staking out, or "**Setting Slope Stakes**," as it is commonly called.

There are two important parts of the work of setting slope stakes :

I. Setting the stakes.

II. Keeping the notes.

The data for setting the stakes are :

(a) The ground with center stakes set at every station (sometimes oftener).

(b) A record of bench marks, and of elevations and rates of grades established.

(c) The base and side slopes of the cross-section for each class of material.

In practice, notes of alignment, a full profile, and various convenient data are commonly given in addition to the above.

206. I. Setting the Stakes. The work consists of :

(a) Marking upon the back of the center stakes the "cut" or "fill" in feet and tenths, as

C 2.3 or F 4.7.

(b) Setting side stakes or slope stakes at each side of the center line at the point where the side slope intersects the surface of the ground, and marking upon the inner side of the stake the "cut" or "fill" at that point.

207. (a) The process of finding the cut or fill at the center stake is as follows :

Given for any station the height of instrument = h_i , and the elevation of grade = h_g .

Then the required rod reading for grade

$$r_g = h_i - h_g. \quad (153)$$

It is not necessary to figure h_g for each station.

Let $h_{g_0} = h_g$ at Sta. 0

$h_{g_1} = h_g$ " " 1

$h_{g_2} = h_g$ " " 2, etc.

Also use similar notation for r_g .

Let g = rate of grade (rise per station)

Then $h_{g_1} = h_{g_0} + g$

$h_{g_2} = h_{g_1} + g$

$h_{g_3} = h_{g_2} + g$, etc.

$r_{g_0} = h_i - h_{g_0}$

$r_{g_1} = h_i - h_{g_1}$

$= h_i - (h_{g_0} + g) = h_i - h_{g_0} - g$

$r_{g_1} = r_{g_0} - g \quad (154)$

Similarly, $r_{g_2} = r_{g_1} - g$, etc.

It will be necessary, or certainly desirable, to figure h_g and r_g anew for each new h_i . It is well to figure h_g and r_g (as a check) for the last station before each turning point.

Example.

$$h_i = 106.25$$

Sta. 0,	grade elevation	100.00	rate + 1.00
5,	"	105.00	" + 0.50
10,	"	107.50	

$$r_{g_0} = 106.25 - 100.00 = 6.25 \quad 6.25$$

$$r_{g_1} = 6.25 - 1.00 = 5.25$$

$$r_{g_2} = 5.25 - 1.00 = 4.25$$

$$r_{g_3} = 4.25 - 1.00 = 3.25$$

$$r_{g_4} = 3.25 - 1.00 = 2.25$$

$$r_{g_5} = 2.25 - 1.00 = 1.25$$

Change in rate

$$r_{g_6} = 1.25 - 0.50 = 0.75$$

$$r_{g_7} = 0.75 - 0.50 = 0.25$$

It is found necessary to take a *T.P.* here, and we therefore find

$$h_{g_7} = h_{g_5} + 2g$$

$$= 105.00 + 1.00 = 106.00$$

$$r_{g_7} = h_i - h_{g_7} = 106.25 - 106.00 = 0.25$$

Therefore all intermediate values r_{g_1}, r_{g_2} , etc., are "checked."

208. Having thus found r_g , next, by holding the rod upon the surface of the ground at the center stake, the rod reading

$r_c = LO$ is observed from the instrument. The cut or fill

$$c = OG = MN - LO$$

$$= r_g - r_c \quad (155)$$

In the figure given the values of r_g and c are positive; a positive value of c indicates a "cut," a negative value of c indicates a "fill."

It can be shown that in the two cases of "fill,"

(1) When h_i is greater than h_g , and

(2) When h_i is less than h_g ,

the formula given will hold good by paying due attention to the sign of r_g , whether + or -.

209. (b) Setting the Stake for the Side Slope.*(1) When the surface is level.***Let** $b = AB = \text{base of section}$ $c = OG = \text{center height}$ $s = \frac{BN}{EN} = \frac{AM}{DM} = \text{side slope}$ $d = OD = OE = \text{distance out}$ **Then** $d = GB + BN$

$$= \frac{1}{2}b + s \times DM = \frac{1}{2}b + s \times EN$$

$$= \frac{1}{2}b + sc$$

(156)**Setting the Stake for the Side Slope.***(2) When the surface is not level.*

Here the process is less simple.

**Let** $b = AB = \text{base}$ $c = OG = \text{center height (or cut)}$ $s = \text{slope}$

$h_r = EK =$ side height right

$h_l = DH =$ " " left

$d_r = GK =$ distance out right

$d_l = GH =$ " " left

Then

$$\left. \begin{aligned} d_r &= \frac{1}{2}b + sh_r \\ d_l &= \frac{1}{2}b + sh_l \end{aligned} \right\} \quad (157)$$

But h_r and h_l are not known. It is evident from the figure that $h_r > c$ and $h_l < c$ in the case indicated, and therefore

$$d_r > \frac{1}{2}b + sc$$

$$d_l < \frac{1}{2}b + sc$$

It would be quite possible in many cases to take measurements such that the rate of slope of the lines OE and OD would be known, and the positions of E and D determined by calculation from such data. But speed and results finally correct are the essentials in this work, and these are best secured by finding h_l and h_r and the corresponding d_l and d_r upon the ground by a series of approximations, as described below.

Having determined c , use this as a basis, and make an estimate at once as to the probable value of h_r at the point where the side slope will intersect the surface, and calculate $d_r = \frac{1}{2}b + sh_r$ to correspond.

Measure out this distance, set the rod at the point thus found, take the rod reading on the surface, and if the cut or fill thus found from the rod reading yields a value of d_r equal to that actually measured out, the point is correct. Otherwise make a new and close approximation from the better data just obtained, always starting with h_r and calculating d_r , and repeat the process until a point is reached where the cut or fill found from the rod reading yields a distance out equal to that taken on the ground. Then set the stake, and mark the cut or fill corresponding to h_r upon the inner side, as previously stated

Perform the same operation in a similar way to determine $d_l = \frac{1}{2}b + sh_l$, and mark this stake also upon the inner side with a cut or fill equal to h_l .

It requires a certain amount of work in the field to appreciate fully the process here outlined, but which in practice is very simple. It may impress some as being unscientific, and at first trial as slow, but with a little practice it is surprising how rapidly, almost by instinct, the proper point is reached, often within the required limits of precision at the first trial, while more than two trials will seldom be necessary, except in difficult country.

The instrumental work is just the same in principle as at the center stake.

Let $r_r = NE =$ rod reading at slope stake right,

then $KN - NE = r_g - r_r = h_r$

here r_g is the same for center, right and left of section.

In some cases it may be necessary to make one or more resettings of the level in order to reach the side stakes from the center stake. In this case, of course, a new r_g must be calculated from the new h_i . This introduces no new principle, but makes the work slower.

A "slope-board" or "level-board" has quite frequently been used to advantage. In certain sections of country this might be considered almost indispensable. It consists simply of a long, straight-edge of wood (perhaps 15 ft. long) with a level mounted in the upper side. It is used with any self-reading rod. A rod quickly hand marked will serve the purpose well. Having given the cut or fill at the center, or at any point in the section, the leveling for the side stakes, and for any additional points, can readily, and with sufficient accuracy, be done by this "level-board," and the necessity for taking new turning points and resetting the level avoided.

210. II. Keeping the Notes.

The form of note-book used for keeping the notes of slope stakes and of center cuts and fills, often called "cross-section" notes, is shown on the following two pages.

The left-hand column for stations should read from bottom to top.

The surface elevations in column 2 are not obtained directly from the levels, but result from adding to the grade elevation at any station the cut or fill at that station, paying due attention to the signs. This column of surface elevations need not be entered up in the field, but may be filled in as office work more economically.

The column of grade elevations consists of the grade elevations as figured for each station.

The figures marked + are cuts in feet and tenths, and those marked - are fills; the figures above the cuts and fills are the distances out from the center, and the position in the notes, whether right or left of the center, corresponds to that on the ground.

The columns on the right-hand page are used for entering, when computed, the "quantities," or number of cubic yards, in each section of earthwork.

The column "General Notes" is used for entering extra measurements (of ditches, etc.) not included in the regular cross-section notes; also notes of material "hauled"; classification of material and various other matters naturally classed under the head of "Remarks."

When the surface is irregular between the center and side stakes, additional rod readings and distances out are taken, and the results entered as shown for station 0 on p. 144, the section itself being as shown below in the sketch.

211. Form of Cross-Section Book (left-hand page).

(Date) (Names of Party) Base 20; 1 to 1 14; 1½ to 1					
Station	Surface Elev.	Grade Elev.	Cross-Section		
5	97.1	105.00	<u>18.4</u> - 7.6	- 7.9	<u>19.4</u> - 8.8
+69.7 P.T.	94.4	104.70	<u>22.1</u> - 10.1	- 10.8	<u>23.0</u> - 10.7
4	96.9	104.00	<u>19.8</u> - 8.2	- 7.1	<u>17.0</u> - 6.7
+27.2 P.C.	98.0	103.27	<u>16.6</u> - 6.4	- 5.8	<u>12.4</u> - 3.6
3	98.1	103.00	<u>16.0</u> - 6.0	- 4.9	<u>10.9</u> - 2.6
+87	100.6	102.87	<u>18.8</u> - 4.2	- 2.3	<u>7.0</u> 0.0
+76	102.8	102.76	<u>10.8</u> - 2.2	0.0	<u>11.9</u> + 1.9
+64	108.7	102.64	<u>10.0</u> 0.0	+ 1.1	<u>18.2</u> + 3.2
+50	106.4	102.50	<u>15.1</u> <u>18.4</u> + 3.4	+ 3.9	<u>17.1</u> + 7.1
2	115.1	102.00	<u>20.0</u> <u>16.7</u> + 6.7	+ 13.1	<u>26.7</u> + 16.7
1	117.7	101.00	<u>29.0</u> <u>22.7</u> + 12.7 + 17.2	+ 16.7	<u>10.0</u> <u>29.3</u> + 13.1 + 12.2
0	109.2	100.00	<u>22.0</u> <u>18.0</u> + 8.0 + 10.1	+ 9.2	<u>8.5</u> <u>18.4</u> + 7.8 + 14.7 + 14.6

213. Cross-sections are taken at every full station, at every *P.C.* or *P.T.* of curve, wherever grade cuts the surface, and in addition, at every break in the surface. In the figure below, showing a profile, sections should be taken at the following stations:—

At Stations 0, 1, 2, 2 + 52, 3, 4, 5, 5 + 80, 6, 7, 8, 9, 9 + 29, 9 + 82, 10, 11, 11 + 30, 12, 12 + 25 *P.C.*, 13, 14, 15, 16, 17 *P.T.*, 18.

214. It is not necessary actually to drive stakes in *all* cases where a cross-section is taken and recorded, but in every case where they will aid materially in construction stakes should be set. It is best to err on the safe side, which is the liberal side. In passing from cut to fill, it is customary to take full cross-sections, not only at the point where the grade line cuts the surface at the *center* line of survey, but also where the grade cuts the surface at the outside of the base, both *right* and *left*, as in the figure below, which illustrates the notes on p. 144; full cross-sections are taken not only at stations 2 + 76, but also at 2 + 64 and 2 + 87.

215. Stakes are actually set at the center G and at the point A, where the outside line of the base of *Excavation* cuts the surface, and at B, where the outside line of the base of *Embankment* cuts the surface. It is not customary to set stakes or record the notes for the points A' and B'. The stakes at A, G, and B are a sufficient guide for construction, and the solidities or "quantities" would in general be affected only slightly by the additional notes if they were made. When the line AGB crosses the center line nearly at right angles, it would not be necessary to take more than one section so far as the notes are concerned. It is well, however, to set the stakes A and B exactly in their proper position.

216. Wherever an opening is to be left in an Embankment for a bridge or for any other structure, stakes should be set as in the figure below : —

At A and B (at the side of the base and top of the slopes AF and BH) stakes should be set marked "*Bank to Grade*"; and at F and H (at the foot of the slopes) stakes should be set marked "*Toe of Slope*." Where the bank is high, an additional stake K at foot of slope may be set as an aid to construction. The stakes at D and E should also be set as ordinary slope stakes.

217. The "level notes" proper, or the record of heights of instrument, bench marks, turning points, etc., used in setting slope stakes, are usually kept separate from the cross-section notes. One reason for this is that level notes run from top to bottom of page, while cross-section notes read from bottom to top of page. The level notes should be kept either in the back

of the cross-section book or in a level book carried for that purpose. Keeping these or any other notes on a slip of paper is bad practice.

218. Earthwork can be most readily computed when the section is a "*Level Section*," that is when the surface is level across the section; but this is seldom the case, and for purposes of final computation it is not often attempted to take measurements upon that basis.

219. In general, in railroad work, the ground is sufficiently regular to allow of "*Three-Level Sections*" being taken, one level (elevation) at the center and one at each slope stake, as shown by these notes, where Base is 20, and Slope $\frac{1}{2}$ to 1:—

$$\begin{array}{r} 11.3 \\ + 2.6 \\ \hline \end{array} \qquad + 4.2 \qquad \begin{array}{r} 12.8 \\ + 5.5 \\ \hline \end{array}$$

The term "*Three-Level Section*" is usually applied only to *regular* sections where the widths of base on each side of the center are the same. In regular three-level sections the calculation of quantities can be made quite simple. To facilitate the final estimation of quantities, it is best to use three-level sections as far as possible.

220. In many cases where three-level sections are not sufficient, it may be possible to use "*Five-Level Sections*," consisting of a level at the center, one at each side where the *base* meets the side slope, and one at each side slope stake, as shown by the following notes:—

Base 20, Slope 1 to 1,

$$\begin{array}{r} 22.7 \\ + 12.7 \\ \hline \end{array} \qquad \begin{array}{r} 10.0 \\ + 17.2 \\ \hline \end{array} \qquad + 16.7 \qquad \begin{array}{r} 10.0 \\ + 13.1 \\ \hline \end{array} \qquad \begin{array}{r} 22.2 \\ + 12.2 \\ \hline \end{array}$$

The term "*Five-Level Section*" is usually applied only to *regular* sections where the base and the side slopes are the same on each side of the center.

221. Where the ground is very rough, levels have to be taken wherever the ground requires, and the calculations must be made to suit the requirements of each special case, although certain systematic methods are generally applicable. Such sections are called "*Irregular Sections*."

CHAPTER XII.

METHODS OF COMPUTING EARTHWORK.

222. In calculating the volumes or “quantities” of Earthwork, the principal methods used are as follows :—

I. AVERAGING END AREAS. II. PRISMOIDAL FORMULA.

223. I. Averaging End Areas.

Let A_0 = area of cross-section at Station 0

[illegible]

l = length of section, Sta. 0 to Sta. 1

V = volume of section of earthwork (Sta. 0 to 1)

$$\text{Then } V = \frac{A_0 + A_1}{2} l \text{ (in cubic feet)} \quad (158)$$

$$= \frac{A_0 + A_1}{2} \cdot \frac{l}{27} \text{ (in cubic yards)} \quad (159)$$

As (158) is capable of expression $V = A_0 \frac{l}{2} + A_1 \frac{l}{2}$

it is practically based on the assumption that the volume consists of two prisms, one of base A_0 and one of base A_1 , and each of a length, or altitude of $\frac{l}{2}$.

224. To use this method, we must find the area A of each cross-section; the cross-section may be:—

(a) *Level.* (b) *Three-Level.* (c) *Five-Level.* (d) *Irregular.*

225. (a) Level Cross-Section.

Let b = base = AB s = side slope = $\frac{DL}{AL} = \frac{EM}{BM}$

c = center ht. = OG
 A = area of cross-section
 Then $DL = EM = sc$
 $A = AB \times OG + DL \times AL$
 $= bc + sc^2$
 $= c(b + sc)$ (160)

226. (b) Three-Level Section. First Method.

Let b = base = AB s = side slope

c = center height

h_r = side height EK h_l = side height DH

d_r = distance out ME d_l = distance out DL

A = area of cross-section

$$\begin{aligned}
 \text{Then } A &= \text{OGD} + \text{OGE} + \text{GBE} + \text{AGD} \\
 &= \frac{1}{2} OG \times DL + \frac{1}{2} OG \times ME + \frac{1}{2} GB \times EK + \frac{1}{2} AG \times DH \\
 &= \frac{1}{2} c(d_l + d_r) + \frac{1}{2} \frac{b}{2} (h_r + h_l) \\
 &= \frac{c(d_l + d_r) + \frac{b}{2} (h_l + h_r)}{2} \quad (161)
 \end{aligned}$$

227. (b) Three Level Section. Second Method.

Using the same notation.

$$\frac{GB}{GV} = s$$

$$GV = \frac{GB}{s} = \frac{b}{2s}$$

$$OV = c + GV = c + \frac{b}{2s}$$

The triangle ABV is often called the "Grade Triangle."²²

$$\text{Area ABV} = GV \times GB$$

$$= \frac{b^2}{4s}$$

$$\text{Area EODV} = OV \times \frac{DL}{2} + OV \times \frac{ME}{2}$$

$$= \left(c + \frac{b}{2s} \right) \frac{d_l + d_r}{2}$$

$$A = \text{EODV} - \text{ABV}$$

$$= \left(c + \frac{b}{2s} \right) \frac{d_l + d_r}{2} - \frac{b^2}{4s}$$

Let

$$D = d_l + d_r$$

$$A = \left(c + \frac{b}{2s} \right) \frac{D}{2} - \frac{b^2}{4s} \quad (162)$$

In using this formula for a *series* of cross-sections of the same base and slope, $\frac{b}{2s}$ and $\frac{b^2}{4s}$ are constants, and the computation of A becomes simple and more rapid than the first method.

228. (c) Five-Level Section.

Use notation the same as before ; in addition let

$$f_r = \text{height MB} ; \quad f_l = \text{height LA}$$

Then $A = \text{LGM} + \text{EMGB} + \text{DLGA}$

$$= \frac{cb}{2} + \frac{f_r d_r}{2} + \frac{f_l d_l}{2}$$

$$A = \frac{cb + f_r d_r + f_l d_l}{2} \quad \checkmark \quad (163)$$

229. (d) Irregular Section.

The "Irregular Section," as shown in the figure, may be divided into trapezoids by vertical lines, as in Fig. 1 ; or into triangles by vertical and diagonal lines, as in Fig. 2.

FIG. 1.

FIG. 2.

The triangles in Fig. 2 can be computed in groups of two, each pair having a common base (vertical). It will be seen that Fig. 1 requires 8 solutions and Fig. 2 only 7 solutions of trape-

zoids or triangles. The computations can be made in either case, after a little experience, directly from the notes without any necessity for a sketch.

In Fig. 2 let $OG = c =$ center cut

h_2, d_2 refer to point L

h_3, d_3 " " " M, etc.

Then

$$A = \frac{c(d_3 + d_5)}{2} + \frac{h_3 d_2}{2} + \frac{h_2(d_1 - d_3)}{2} + \frac{h_1\left(\frac{b}{2} - d_2\right)}{2} \\ + \frac{h_5 d_6}{2} + \frac{h_6(d_r - d_5)}{2} - \frac{h_r\left(d_6 - \frac{b}{2}\right)}{2}$$

In the sections shown above, the base has been the regular base of roadbed, common to both regular and irregular sections. It may often happen that it will be necessary to take sections which are altogether irregular, perhaps with a base of irregular width and not in the form of a plane surface, as in the figure immediately below.

Such sections can almost always be divided into triangles and into pairs of triangles, and computed very much as is done in the case of Fig. 2 above.

A common form of section is one where part is in cut and part in fill as shown in the figure below.

This section also may be considered a special case of Irregular Section, and divided into convenient triangles, and into pairs of triangles so far as is feasible.

230. Another method which has been used for calculating irregular cross-sections is to plat them on cross-section paper, and get the area by "*Planimeter*." In very irregular cross-sections this method would prove economical as compared with direct computation by ordinary methods, but it is probable that in almost every case equal speed and equal precision can be obtained by the use of suitable tables or diagrams (to be explained later); for this reason the use of the planimeter is not recommended, certainly where diagrams are available.

231. Whatever may be the form of section, or whatever the method of computation, having found the values of A for each cross-section, the volume V is found for the End Area Method, by the formula above given.

$$V = \frac{A_0 + A_1}{2} \cdot \frac{l}{27} \text{ (in cu. yds.)} \quad (159)$$

It is found that this formula is only approximately correct. Its simplicity and *substantial accuracy* in the majority of cases render it so valuable that it has become the formula in most common use. It gives results, in general, larger than the true solidity.

232. II. Prismoidal Formula.

"A prismoid is a solid having for its two ends any dissimilar parallel plane figures of the same number of sides, and all the sides of the solid plane figures also."

Any prismoid may be resolved into prisms, pyramids, and wedges, having as a common altitude the perpendicular distance between the two parallel end planes.

Let A_0 and A_1 = areas of end planes.

M = area of middle section parallel to the end planes.

l = length of prismoid, or perpendicular distance between end planes.

V = volume of the prismoid.

Then it may be shown that

$$V = (A_0 + 4M + A_1) \frac{l}{6}$$

233. Let B = area of lower face, or base of a prism, wedge, or pyramid.

b = area of upper face.

m = middle area parallel to upper and lower faces.

a = altitude of prism, wedge, or pyramid.

s = solidity “ “ “ “ “

Then the area of the *upper face* b in terms of *lower base* B will be for

Prism	Wedge	Pyramid
$b = B$	$b = 0$	$b = 0$

and the *middle area* m will be for

Prism	Wedge	Pyramid
$m = B$	$m = \frac{B}{2}$	$m = \frac{B}{4}$

The solidity s will be for

Prism

$$s = aB = \frac{a}{6} \cdot 6B = \frac{a}{6} (B + 4B + B) = \frac{a}{6} (B + 4m + b)$$

Wedge

$$s = \frac{aB}{2} = \frac{a}{6} \cdot 3B = \frac{a}{6} \left(B + \frac{4B}{2} + 0 \right) = \frac{a}{6} (B + 4m + b)$$

Pyramid

$$s = \frac{aB}{3} = \frac{a}{6} \cdot 2B = \frac{a}{6} \left(B + \frac{4B}{4} + 0 \right) = \frac{a}{6} (B + 4m + b)$$

Since a prismoid is composed of prisms, wedges, and pyramids, the same expression may apply to the prismoid, and this may be put in the general form

$$V = (A_0 + 4M + A_1) \frac{l}{6} \quad (163 A)$$

using the notation of the preceding page.

234. A regular section of earthwork having for its surface a plane face is a prismoid. Most sections of earthwork have not their surface plane, and are not strictly prismoids, although they are so regarded by some writers.

In this figure the lines E_0O_0 and E_1O_1 are not parallel, and therefore the surface $O_0O_1E_1E_0$ is not a plane. The most common assumption as to this surface is that the lines O_0O_1 and E_0E_1 are right lines, and that the surface $O_0O_1E_1E_0$ is a warped surface, generated by a right line moving as a generatrix always

parallel to the plane $O_0G_0B_0E_0$ and upon the lines O_0O_1 and E_0E_1 as directrices, as indicated in the figure. The surface thus generated is a warped surface called a "hyperbolic paraboloid." It will be shown that the "prismoidal formula" applies also to this solid, which is not, however, properly a prismoid.

235. In the following figure, which has perpendicular sides $D_0A_0A_1D_1$, $E_0B_0B_1E_1$ and the lines D_0E_0 and D_1E_1 right lines,

let $b_0 =$ base $= A_0B_0$

$b_1 =$ " $= A_1B_1$

$c_0 =$ center ht. $= O_0G_0$
 $= \frac{D_0A_0 + E_0B_0}{2}$

$c_1 =$ center ht. $= O_1G_1$
 $= \frac{D_1A_1 + E_1B_1}{2}$

$l =$ length (altitude)
of section $= G_0G_1$

$A_0 =$ area of $D_0A_0B_0E_0$

$A_1 =$ area of $D_1A_1B_1E_1$

$V =$ volume

Also use notation b_x , c_x , A_x for a section distant x from G_1 .

Then

$$A_0 = b_0 c_0 \quad A_1 = b_1 c_1$$

$$b_x = b_1 + (b_0 - b_1) \frac{x}{l}$$

$$c_x = c_1 - (c_1 - c_0) \frac{x}{l} = c_1 + (c_0 - c_1) \frac{x}{l}$$

$$A_x = b_x c_x = \left[b_1 + (b_0 - b_1) \frac{x}{l} \right] \left[c_1 + (c_0 - c_1) \frac{x}{l} \right]$$

$$\begin{aligned} V &= \int_0^l \left[b_1 + (b_0 - b_1) \frac{x}{l} \right] \left[c_1 + (c_0 - c_1) \frac{x}{l} \right] dx \\ &= b_1 c_1 l + [b_1(c_0 - c_1) + c_1(b_0 - b_1)] \frac{l^2}{2} + \frac{(b_0 - b_1)(c_0 - c_1)l^3}{3l^2} \end{aligned}$$

$$= \frac{l}{6} \left\{ \begin{array}{l} 6 b_1 c_1 + 3 b_1 c_0 + 3 b_0 c_1 + 2 b_0 c_0 \\ - 3 b_1 c_1 - 2 b_1 c_0 - 2 b_0 c_1 \\ - 3 b_1 c_1 \\ + 2 b_1 c_1 \end{array} \right\}$$

$$V = \frac{l}{6} (2 b_1 c_1 + 2 b_0 c_0 + b_1 c_0 + b_0 c_1) \quad (164)$$

236. Apply the "Prismoidal Formula" to the same section.

The base and center height of the middle section are :—

$$b_m = \frac{b_0 + b_1}{2}$$

$$c_m = \frac{c_0 + c_1}{2}$$

$$A_0 = b_0 c_0$$

$$A_1 = b_1 c_1$$

$$M = \frac{b_0 + b_1}{2} \times \frac{c_0 + c_1}{2} = \text{area of middle section}$$

$$V = \frac{l}{6} (A_0 + 4 M + A_1)$$

$$= \frac{l}{6} (b_0 c_0 + b_0 c_0 + b_0 c_1 + b_1 c_0 + b_1 c_1 + b_1 c_1)$$

$$= \frac{l}{6} (2 b_1 c_1 + 2 b_0 c_0 + b_1 c_0 + b_0 c_1) \quad (165)$$

This is the same as formula (164) found above to be correct for the warped surface. Therefore the "Prismoidal Formula" (163 A) applies to the section shown in § 235.

237. The sections of earthwork commonly used in railroad work are bounded not by perpendicular sides, but by inclined planes.

In the figure, suppose a plane to be passed through the line E_0E_1 , cutting A_0B_0 at P_0 and A_1B_1 at P_1 . The prismoidal formula applies to the solid $E_0P_0B_0B_1E_1P_1$ cut out by this plane, since this solid is a true prismoid. If the prismoidal formula applies to the entire solid, and also to the part cut out, it must apply to the re-

maining solid $D_0A_0P_0E_0E_1P_1A_1D_1$, and this represents in form one side of a regular three-level section of earthwork in which D_0A_0 represents the center height and E_0P_0 the slope.

If the prismoidal formula applies to the section upon one side of the center, it applies also to the other side, and so to the entire section.

238. The "*Prismoidal Formula*" is of wide application. Since it applies to prisms, wedges, pyramids, and to solids bounded by warped surfaces generated as described, it follows that it applies to any solid bounded by two parallel plane faces and defined by the surfaces generated by a right line moving upon the perimeters of these faces as directrices. It may also be stated here without demonstration that it also applies to the *frusta* of all solids generated by the revolution of a conic section as well as to the complete solids, for instance, the sphere.

The prismoidal formula is generally accepted as correct for the computation of earthwork and similar solids, and the measurements of a section of earthwork are taken so as to represent properly the surface of the ground if this be a warped surface of the sort described. The failure to use the prismoidal formula is explained often by the additional labor necessary for its use.

239. For "three-level" sections of earthwork, a result correct by the prismoidal formula may be secured, and the work simplified, by calculating the quantities first by the inexact method of "end areas," and then applying a *correction* which we may call "**The Prismoidal Correction.**"

Let V_e = solidity by end areas

V_p = " " prismoidal formula

Then $C = V_e - V_p$ = prismoidal correction

In the figure, § 235,

$$V_p = \text{by formula (164)} = \frac{l}{6} (2 b_1 c_1 + 2 b_0 c_0 + b_1 c_0 + b_0 c_1)$$

$$V_e = \frac{l}{2} (b_1 c_1 + b_0 c_0) = \frac{l}{6} (3 b_1 c_1 + 3 b_0 c_0)$$

$$\begin{aligned} C = V_e - V_p &= \frac{l}{6} (b_1 c_1 + b_0 c_0 - b_1 c_0 - b_0 c_1) \\ &= \frac{l}{6} (b_1 - b_0)(c_1 - c_0) \quad \checkmark \end{aligned}$$

Let $D_0 A_0 = h_0'$

$D_1 A_1 = h_1'$

$E_0 B_0 = h_0$

$E_1 B_1 = h_1$

$$\begin{aligned} \text{Then } C &= \frac{l}{6} (b_1 - b_0) \left(\frac{h_1 + h_1'}{2} - \frac{h_0 + h_0'}{2} \right) \\ &= \frac{l}{12} (b_1 - b_0) (h_1 + h_1' - h_0 - h_0') \end{aligned}$$

When the solid assumes a triangular cross-section, as in the figure,

$$h_0' = 0 \quad h_1' = 0$$

$$C = \frac{l}{12} (b_1 - b_0) (h_1 - h_0) \quad (166)$$

240. If any solid be divided into a number of solids each of triangular cross-section, the above correction may be applied to each such triangular solid, and the sum of the corrections will be the correction for the entire solid.

Let this figure represent a section of earthwork divided into three parts, as indicated by the lines D_0G_0 , E_0G_0 , D_1G_1 , E_1G_1 .

Then, for the solid $O_0D_0G_0E_0E_1G_1D_1O_1$,

$$\begin{aligned} C &= \frac{l}{12} [(c_1 - c_0)(d_{l_1} - d_{l_0}) + (c_1 - c_0)(d_{r_1} - d_{r_0})] \\ &= \frac{l}{12} (c_1 - c_0)(d_{l_1} + d_{r_1} - d_{l_0} - d_{r_0}) \end{aligned}$$

Let $D_1 = d_{l_1} + d_{r_1}$ and $D_0 = d_{l_0} + d_{r_0}$

$$C = \frac{l}{12} (c_1 - c_0)(D_1 - D_0)$$

For the solid $G_0B_0E_0E_1B_1G_1$,

$$\begin{aligned} (166) \quad C &= \frac{l}{12} \left(\frac{b_1}{2} - \frac{b_0}{2} \right) (h_{r_1} - h_{r_0}) \\ &= \frac{l}{12} (0)(h_{r_1} - h_{r_0}) \\ &= 0 \end{aligned}$$

Similarly for the solid $A_0G_0D_0D_1G_1A_1$.

Hence for the entire solid $A_0B_0E_0O_0D_0D_1O_1E_1B_1A_1$.

$$C = \frac{l}{12} (c_1 - c_0)(D_1 - D_0) \quad (167)$$

When $l = 100$

$$C_{100} = \frac{100}{12 \times 27} (c_1 - c_0)(D_1 - D_0)$$

$$= \frac{1}{3.24} (c_1 - c_0)(D_1 - D_0) \text{ in cu. yds.} \quad (168)$$

Since $C = V_e - V_p, \quad V_p = V_e - C \quad (169)$

✓ When $(c_1 - c_0)(D_1 - D_0)$ is *positive*, the correction C is to be *subtracted* from V_e .

When $(c_1 - c_0)(D_1 - D_0)$ is *negative*, the arithmetical value of C is to be *added* to V_e . The latter case seldom occurs in practice, except where C is very small, perhaps small enough to be neglected.

For the purposes of the prismoidal correction it should be borne in mind that the signs $+$ or $-$ mean simply *cut* or *fill*, and *should not be considered* in determining whether to add or subtract the correction.

For a section of length l , $C_l = \frac{l}{100} C_{100}$

$$V_{pl} = \frac{l}{100} (V_{e100} - C_{100}) \quad (169 A)$$

The prismoidal correction has two principal forms. For a solid bounded by ends of triangular section the form is

$$C = \frac{l}{12} (b_1 - b_0)(h_1 - h_0) \quad (166)$$

This should be considered the fundamental form. In the case of regular "Three Level Sections" it takes a secondary or special form

$$C = \frac{l}{12} (c_1 - c_0)(D_1 - D_0) \quad (167)$$

This last formula can be used only when the width of base is the same at both ends of the section. From the method of its derivation it is evident that for the right half of a regular three level section

$$C_r = \frac{l}{12} (c_1 - c_0)(d_{r_1} - d_{r_0}) \quad (167 A)$$

241. In passing from cut to fill as in the figure

for the right half $C_r = \frac{l}{12} (c_1 - c_0) (d_{r1} - d_{r0})$ from (167 A)

for the left side $C_l = \frac{l}{12} (c_1 - c_0) \left(\frac{b}{2} - 0 \right)$ from (166)

$$C = \frac{l}{12} (c_1 - c_0) (D_1 - d_{r0})$$

For the special case of a side hill section

the prismoidal correction for cut will be

$$C_c = \frac{l}{12} (c_1 - c_0) (\overline{d_{r1} + d_{k1}} - \overline{d_{r0} + d_{k0}})$$

the prismoidal correction for fill will be

$$C_f = \frac{l}{12} (h_{l1} - h_{l0}) \left(\frac{b}{2} - d_{k1} - \overline{\frac{b}{2} - d_{k0}} \right)$$

$$= \frac{l}{12} (h_{l1} - h_{l0}) (d_{k0} - d_{k1})$$

242. Formula (166) can also be used to find the correction for the triangular pyramids (for excavation Sta. 2+76 to 2+87, and embankment 2+64 to 2+76), *each end of the pyramid* being considered to have a triangular section. A much simpler way to find the correction for a pyramid is this,

$$C = V_e - V_p = \frac{1}{3}V_e$$

as may readily be shown to be true for any pyramid, since

$$V_e = A \frac{l}{2}$$

$$V_p = A \frac{l}{3}$$

$$C = V_e - V_p = A \frac{l}{6} \quad (170)$$

since by the End Area method $V_e = A \frac{l}{2} + 0$

$$C = \frac{V_e}{3} \quad (171)$$

243. In the case of regular “**Five-Level Sections**,” as shown in the figure, p. 152, the prismoidal correction may be computed for each of the triangular masses bounded by

- | | | |
|--------|---------|---------|
| 1. LGM | 2. MEBG | 3. LDAG |
|--------|---------|---------|

In the case of LGM, the prismoidal correction will evidently be = 0, since $D_0 = AB = D_1$, and therefore $D_0 - D_1 = 0$.

The correction for the mass bounded on one end by

$$\text{MEBG} = C = \frac{l}{12} (f_{r_0} - f_{r_1}) (d_{r_0} - d_{r_1}) \quad \text{from (166)}$$

and by $\text{LDAG} = C = \frac{l}{12} (f_{l_0} - f_{l_1}) (d_{l_0} - d_{l_1}) \quad \text{from (166)}$

244. In the case of “**Irregular Sections**,” the prismoidal correction cannot with convenience be accurately employed. There are, however, several methods by which we may calculate a “prismoidal correction” which will be approximately correct, and good enough for practical purposes.

Inspection of the formula $C = \frac{l}{12}(c_1 - c_0)(D_1 - D_0)$ (167)

makes it clear that the correction will be large when the two end sections differ much in size, and small when the end sections are nearly equal. Ordinarily in a large section both c and D are large. For any *given area of section* in a regular three-level section, if c is made smaller, D must be increased in nearly like measure, and formula (167) will show little change in the value of C even if c be changed, if the area remains the same.

For the purpose *only* of finding the prismoidal correction there are several approximate methods based on the principle above stated.

1. Where the section is only slightly irregular. Neglect all intermediate heights and figure correction from c and D . This is a very simple method.

Where more careful results seem desirable,

2. Find c and D for an "equivalent level section"; that is, a level section of equal area to the irregular section. Use the c and D thus determined in computing the prismoidal correction. These can be used with the c and D of a regular three-level section, or with the c and D of another equivalent level section.

The c and D of the equivalent level section may be found from Tables or from Diagrams, whose use will be shown in later chapters.

3. Find an equivalent regular three-level section (not level) either by

- (a) retaining c and computing D , or
- (b) retaining D and computing c .

The method of doing this will be made simple by Diagrams described in a later chapter.

4. Plot the irregular section on cross-section paper, and draw lines to form a regular three-level section which will closely approximate, in form, to the irregular section, and find c and D .

While the results obtained by any of the above methods are approximate, the resulting error can be only a small fraction of the entire correction, which is itself small.

The method of averaging end areas and applying the prismoidal correction allows of great rapidity, and secures great precision, and well meets the requirements of modern railroad practice.

SPECIAL PROBLEMS.

In the case of a curve, the ends of a section of earthwork are not parallel, but are in each case normal to the curve. In calculating the solidity of a section of earthwork, we have heretofore assumed the ends parallel, and for curves this is equivalent to taking them perpendicular to the chord of the curve between the two stations.

[illegible]

QGS. When the cross-sections on each side of the center are equal, these masses balance each other. When the cross-section on one side differs much in area from that on the other, the correction necessary may be considerable.

In Fig. 2, use c , h_l , h_r , d_l , d_r , b , s , as before.

Let D = degree of curve. Make $BL = AD$, and join OL .

FIG. 1.

Then ODAG balances OLBG, and there remains an unbalanced area OLE.

Draw OKP parallel to AB.

By the "Theorem of Pappus" (see Lanza, Applied Mechanics), "If a plane area lying wholly on the same side of a straight line in its own plane revolves about that line, and thereby generates a solid of revolution, the volume of the solid thus generated is equal to the product of the revolving

area and of the path described by the center of gravity of the plane area during the revolution."

The correction for curvature, or the solidity, developed by this triangle OLE (Fig. 2) revolving about OG as an axis will be its area $\times$ the distance described by its center of gravity. The distance out (horizontal) to the center of gravity from the axis (center line) will be two thirds of the mean of the distances out to E and to L, or

FIG. 2.

$$= \frac{2}{3} \cdot \frac{d_l + d_r}{2}$$

and the distance described will be

$$\frac{2}{3} \cdot \frac{d_l + d_r}{2} \times \text{angle QGS}$$

The area

$$\text{OLE} = \text{OK} \times \frac{\text{NL} + \text{PE}}{2}$$

$$= \left(\frac{b}{2} + sc \right) \frac{h_r - h_l}{2}$$

Therefore the correction for curvature,

$$C = \left(\frac{b}{2} + sc \right) \cdot \frac{h_r - h_l}{2} \cdot \frac{d_r + d_l}{3} \times \text{angle QGS}$$

When IG, GT are each a full station, or 100 ft. in length,

$$\text{QGS} = D$$

$$C = \left(\frac{b}{2} + sc \right) \cdot \frac{h_r - h_l}{2} \cdot \frac{d_r + d_l}{3} \times \text{angle } D$$

$$\text{arc } 1^\circ = .01745$$

$$C = \left(\frac{b}{2} + sc \right) \frac{h_r - h_l}{2} \times \frac{d_r + d_l}{3} \times 0.01745 D$$

$$= \left(\frac{b}{2} + sc \right) (h_r - h_l) (d_r + d_l) \times 0.00291 D \text{ (cu. ft.)} \quad (172)$$

$$= \left(\frac{b}{2} + sc \right) (h_r - h_l) (d_r + d_l) \times 0.00011 D \text{ (cu. yds.)} \quad (173)$$

246. When IG or GT, or both, are less than 100 ft., let

$$\text{IG} = l_0 \quad \text{and} \quad \text{GT} = l_1$$

$$\text{Then} \quad \text{QGE} = \frac{l_0}{100} \times \frac{D}{2} \text{ and } \text{SGE} = \frac{l_1}{100} \times \frac{D}{2}$$

$$\text{QGS} = \frac{l_0 + l_1}{200} D$$

$$C = \left(\frac{b}{2} + sc \right) (h_r - h_l) (d_r + d_l) \frac{l_0 + l_1}{200} \times 0.00011 D \text{ (cu. yds.)} \quad (174)$$

247. The correction C is to be added when the greater area is on the outside of the curve, and subtracted when the greater area is on the inside of the curve.

When the center height is 0, as in Fig. 3, we may consider this a regular section in which $c = 0$,

$h_l = 0$, and $d_l = \frac{b}{2}$; then

FIG. 3.

$$C = \frac{b}{2} \times h_r \times \left(d_r + \frac{b}{2} \right) \frac{l_0 + l_1}{200} \times 0.00011 D \text{ (cu. yds.)} \quad (175)$$

In the case of an irregular section, as shown in Fig. 4, the area and distance to center of gravity (for example, of OHEML) may be found by any method available, and the correction

FIG. 4.

figured accordingly. The correction for curvature is, in present railroad practice, more frequently neglected than used. Nevertheless, its amount is sufficient in many cases to fully warrant its use.

248. Opening in Embankment.

Where an opening is left in an embankment, there remains outside the regular sections the mass DEKHF.

This must be calculated in 3 pieces, ADF, BEKH, ABHF.

- Let b = base = AB
 d_r = distance out right
 d_l = distance out left
 p_r = BH
 p_l = AF } taken parallel to center line
 f_r = } heights at { B
 f_l = } heights at { A
 s_1 = solidity ADF
 s_2 = BEKH
 s_3 = ABHF

Then (approximately) following the "Theorem of Pappus,"
 s_1 = mean of triangular sections AD and AF $\times$ distance described by center of gravity.

In the quarter cone AFD, $AF = p_l$

$$AD = d_l - \frac{b}{2}$$

$$\text{Then average radius } R_l = mh = \frac{AF + AD}{2}$$

$$\text{Area of vertical triangular section } A_l = \frac{f_l R_l}{2}$$

$$\text{Distance from A to center of gravity of vertical section} = \frac{R_l}{3}$$

$$\text{Arc described by center of gravity} = \frac{R_l}{3} \times \frac{\pi}{2} = \frac{\pi R_l}{6}$$

$$s_1 = \frac{f_l R_l}{2} \times \frac{\pi R_l}{6} \text{ (cu. ft.)}$$

$$= \frac{f_l R_l^2 \times 3.1416}{2 \times 6 \times 27} \text{ (cu. yds.)}$$

$$s_1 = 0.0097 f_l R_l^2 \text{ (cu. yds.)} \quad (176)$$

Similarly, in the quarter cone BEKH

$$\text{The average radius } R_r = \frac{BH + 2BK + BE}{4}$$

$$s_2 = \frac{f_r R_r}{2} \times \frac{\pi R_r}{6} \text{ (cu. ft.)}$$

$$s_2 = 0.0097 f_r R_r^2 \text{ (cu. yds.)} \quad (177)$$

For the solid AGBHF

$$\begin{aligned} s_3 &= \frac{\text{area AF} + \text{area BH}}{2} \times AB \\ &= \frac{(f_l p_l + f_r p_r) b}{4} \end{aligned} \quad (178)$$

The work of deriving formulas (176) and (177) is approximate throughout, but the total quantities involved are in general not large, and the error resulting would be unimportant.

There seems to be no method of accurately computing this solidity which is adapted to general railroad practice.

249. Borrow-Pits.

In addition to the ordinary work of excavation and embankment for railroads, earth is often "borrowed" from outside the limits of the work proper; and in such excavations called "borrow-pits," it is common to prepare the work by dividing the surface into squares, rectangles, or triangles, taking levels at every corner upon the original surface; again, after the excavation of the borrow-pit is completed, the points are reproduced and levels taken a second time. The excavation is thus divided into a series of vertical prisms having square, rectangular, or triangular cross-sections. These prisms are commonly truncated top and bottom. The lengths or altitudes of the vertical edges of these prisms are given by the difference in levels taken,

1st, on the original surface, and

2d, after the excavation is completed.

This method of measurement is very generally used, and for many purposes.

250. Truncated Triangular Prisms.

Let A = area of right section EFD of a truncated prism, the base ABC being a right section

h_1 = height AH

h_2 = " BE

h_3 = " CK

a = altitude of triangle EFD dropped from E to FD

Let V = volume of prism ABCKHE

s_l = solidity " " ABCFDE

s_u = " " pyramid FDEHK

Then $s_t = A \times AD = A \times \frac{3AD}{3} = A \times \frac{AD + BE + CF}{3}$

$$s_u = \text{area DFKH} \times \frac{a}{3}$$

$$= \frac{KF + HD}{2} \times FD \times \frac{a}{3}$$

$$= \frac{KF + HD}{3} \times FD \times \frac{a}{2}$$

$$= \frac{KF + HD}{3} \times A$$

$$V = s_t + s_u = A \left(\frac{AD + BE + CF}{3} + \frac{KF + HD}{3} \right)$$

$$= A \frac{(AD + HD) + BE + (CF + KF)}{3}$$

$$= A \frac{h_1 + h_2 + h_3}{3} \quad (179)$$

If the prism be truncated top and bottom, the same reasoning holds and the same formula applies.

251. Truncated Rectangular Prism.

Let A = area of right section ABCD
of a rectangular prism
truncated on top (base
is ABCD)

h_1 = height AE

h_2 = " BG

h_3 = " KC

h_4 = " HD

V = volume of prism

b = AD = BC

a = AB = DC

Then using method of end areas,

$$\begin{aligned}
 V &= \frac{AEHD + BGKC}{2} \times a \\
 &= \frac{b \frac{h_1 + h_4}{2} + b \frac{h_2 + h_3}{2}}{2} \times a \\
 &= ab \frac{h_1 + h_2 + h_3 + h_4}{4} \\
 V &= A \frac{h_1 + h_2 + h_3 + h_4}{4} \text{ (cu. ft.)} \quad (180)
 \end{aligned}$$

$$V = \frac{A}{27} \cdot \frac{h_1 + h_2 + h_3 + h_4}{4} \text{ (cu. yds.)} \quad (181)$$

We may find V , correct by the prismoidal formula, if we apply the prismoidal correction. The prismoidal correction $C = 0$, since $D_0 - D_1 = 0$ (or in this case $AD - BC = 0$). The formula therefore remains unchanged. It is evident from this, then, that the solution holds good, and the formula is correct, not only when the surface $E H K G$ is a plane, but also when it is a warped surface generated by a right line moving always parallel to the plane $ADHE$, and upon EG and HK as directrices.

Some engineers prefer to cross-section in rectangles of base $15' \times 18'$. In this case

$$\begin{aligned}
 V &= \frac{15' \times 18'}{27} \cdot \frac{h_1 + h_2 + h_3 + h_4}{4} \text{ (cu. yds.)} \\
 &= 10 \frac{h_1 + h_2 + h_3 + h_4}{4} \text{ (cu. yds.)} \quad (182)
 \end{aligned}$$

Other convenient dimensions will suggest themselves, as

$$10' \times 13.5' \quad \text{or} \quad 20' \times 13.5' \quad \text{or} \quad 20' \times 27'$$

By this method the computations are rendered slightly more convenient; but the size of the cross-section, and the shape, whether square or rectangular, should depend on the topography. The first essential is accuracy in results, the second is simplicity and economy in field-work, and ease of computation should be subordinate to both of these considerations.

252. Assembled Prisms.

In the case of an assembly of prisms of equal base, it is not necessary to separately calculate each prism, but the solidity of a number of prisms may be calculated in one operation.

In the prism B,

$$V_B = A \frac{a_2 + a_3 + b_3 + b_2}{4}$$

$$V_C = A \frac{a_3 + a_4 + b_4 + b_3}{4}, \text{ etc.}$$

From inspection it will be seen, taking A as the common area of base of a single prism, and taking the sum of the solidities, that the heights a_2, a_5 enter into the calculation of

one prism only ; a_3, a_4 into two prisms each ; b_1, b_6 one only ; b_2, b_5 into three prisms ; b_3, b_4 into four prisms ; and similarly throughout.

Let t_1 = sum of heights common to one prism
 t_2 = " " " " " two prisms
 t_3 = " " " " " three "
 t_4 = " " " " " four "

Then the total volume,

$$V_t = A \frac{t_1 + 2t_2 + 3t_3 + 4t_4}{4} \text{ (cu. ft.)} \quad (183)$$

$$V_t = \frac{A}{27} \cdot \frac{t_1 + 2t_2 + 3t_3 + 4t_4}{4} \text{ (cu. yds.)} \quad (184)$$

253. Additional Heights.

When the surface of the ground is rough it is not unusual to take additional heights, the use of which, in general, involves appreciable labor in computation, it being necessary commonly to divide the solid into triangular prisms, as suggested by the figures just below, which include the case of a trapezoid.

The computations may be simplified in the two special cases which follow :

(a) When the additional height h_c is in the center of the rectangle.

Here the solid is composed of an assembly of 4 triangular prisms whose right sections are of equal area $= \frac{A}{4}$.

The volume of the assembled prisms

$$\begin{aligned}
 V &= \frac{A}{4} \cdot \frac{2h_1 + 2h_2 + 2h_3 + 2h_4 + 4h_c}{3} \\
 &= \frac{A}{12} (2h_1 + 2h_2 + 2h_3 + 2h_4 + 4h_c) \\
 &= \frac{A}{12} (3h_1 + 3h_2 + 3h_3 + 3h_4) + \frac{A}{12} (4h_c - h_1 - h_2 - h_3 - h_4) \\
 V &= A \frac{h_1 + h_2 + h_3 + h_4}{4} + \frac{A}{3} \left(h_c - \frac{h_1 + h_2 + h_3 + h_4}{4} \right) \quad (185)
 \end{aligned}$$

or the total volume is that due to the four corner heights plus the volume of a pyramid of equal area of base and whose altitude is the difference between the center height and the mean of the four corner heights.

(b) When the additional height is at the middle of one side of the rectangle.

$$V = \frac{1}{3} \cdot \frac{A}{4} (h_1 + h_m + h_3 + h_2 + h_4 + h_m) +$$

$$\frac{1}{3} \cdot \frac{A}{2} (h_m + h_4 + h_3)$$

$$V = \frac{A}{12} (h_1 + h_m + h_3 + h_2 + h_4 + h_m + 2h_m + 2h_4 + 2h_3)$$

$$= \frac{A}{12} (h_1 + h_2 + 3h_3 + 3h_4 + 4h_m)$$

$$= \frac{A}{12} (3h_1 + 3h_2 + 3h_3 + 3h_4) + \frac{A}{12} (4h_m - 2h_1 - 2h_2)$$

$$= A \frac{h_1 + h_2 + h_3 + h_4}{4} + \frac{A}{3} \left(h_m - \frac{h_1 + h_2}{2} \right) \quad (185 A)$$

or the total solidity is that due to the four corner heights plus the solidity of a pyramid of equal area of base and whose altitude is the difference between the middle height and the mean of the adjacent side heights.

Apparently the principle of the pyramid applies conveniently only in these two cases.

For the case where the point lies on one of the sides, an alternate method of dividing the rectangle (or trapezoid) is indicated below.

The details of the computation in this case need not be worked out here.

254. The common practice in the case of borrow-pits is that stated in § 249. When the original surface and the surface to which the excavation is made are both somewhat rough and irregular, this method is naturally and properly adopted.

In many cases of excavation, the work is carried to a finished surface, sometimes a plane surface, or several planes, or some other very simple surface, sometimes to a more complicated surface where cross-sectioning the finished surface would not readily allow the facts to be shown on the plan.

In either of these cases the following method seems preferable.

(a) Cross-section the original surface as before.

(b) Assume a convenient horizontal plane, slightly lower than the surface to which the excavation has been carried.

(c) Find the total earthwork to the original cross-sectioned surface, above this assumed plane as a base.

(d) Find the total earthwork to the finished surface, above the assumed plane as a base. In many cases this surface will be bounded by only a few planes and thus will allow very simple computations.

(e) Find the difference between (c) and (d); this will give the amount of earthwork excavated.

255. It often happens that an excavation is made of considerable length and not great breadth, and often of not great depth. In stripping soil under a proposed embankment these conditions prevail. The excavation can then best be handled very much as excavation is handled on railroads. A *line* will be run, and a series of cross-sections taken, the *line* serving as a center line, and cross-sections being taken at + stations along the line as often as required by the surface conditions. The cross-sections will be very irregular, not having any uniform base, but much as represented in the figure below.

256. To find the area of these irregular sections, it may frequently happen that the best method may be one similar to that described for cross-sectioning on the preceding page.

- (a) Find elevations on original surface ABCDE.
- (b) Find elevations on excavated surface FGHIKLE.
- (c) Assume a horizontal line at a convenient elevation MN.
- (d) Calculate area MFBCDEN.
- (e) Calculate area MFGHIKLEN.
- (f) Area required is the difference between (d) and (e).

257. It is frequently necessary to find the excavation made by digging into the side of a high bank. Cross-section points on a steep slope, often in loose sand, cannot be expected to yield good results for computing excavation.

In such cases the following method may prove valuable.

- (a) Determine with care both the position and elevation of point A at edge of top of bank; also of B near bottom of slope.
- (b) Sight from A to bottom of stake at B and read on leveling rod CC', DD', etc., at the same time measuring AC, AD, etc.
- (c) After the excavation has been made, find the positions of A' and B'; also the distances HH', LL', etc.; also A'H, A'L, etc.
- (d) Plot on cross-section paper and measure area between original surface and excavated surface. This can probably be done to best advantage by planimeter.

CHAPTER XIV.

EARTHWORK TABLES.

258. The calculation of quantities can be much facilitated by the use of suitably arranged "Earthwork Tables."

For regular "Three-Level Sections" very convenient tables can be calculated upon the following principles or formulas:—

Use notation as before for

$c, h_l, h_r, d_l, d_r, s, l, A, S$

$$\begin{aligned}
 \text{Then } A &= \text{ABKL} + \text{OKE} - \text{ODL} \\
 &= c(b + sc) + \frac{\text{OK} \times \text{EM}}{2} - \frac{\text{OL} \times \text{ND}}{2} \\
 &= c(b + sc) + \frac{\text{OK}}{2}(\text{EM} - \text{ND}) \\
 &= c(b + sc) + \frac{1}{2} \left(\frac{b}{2} + sc \right) (h_r - c - c + h_l) \\
 A &= c(b + sc) + \frac{1}{2} \left(\frac{b}{2} + sc \right) (h_l + h_r - 2c)
 \end{aligned}$$

For a prism of base A and $l = 50$, the solidity

$$S = 50 A \text{ (cu. ft.)} = \frac{50}{27} A \text{ (cu. yds.)}$$

$$S = \frac{50}{27} c(b + sc) + \frac{25}{27} \left(\frac{b}{2} + sc \right) (h_l + h_r - 2c) \text{ (cu. yds.)} \quad (186)$$

259. For cross-sections of a given base and slope, that is, given b and s constant, we may calculate for successive values of c , and tabulate values of L and K as follows:—

	L	K
c	$\frac{50}{27}c(b + sc)$	$\frac{25}{27}\left(\frac{b}{2} + sc\right)$

L represents the solidity for the *level section*.

K is for use as a correction. The formula then adapts itself to this table for any desired values of c , h_l , h_r .

$$S = L + K(h_l + h_r - 2c) \quad (186 A)$$

Having found for successive stations S_0 and S_1 (each for a prism $l = 50$), then for the *full section* by “end areas,”

$$V_{e100} = S_0 + S_1$$

$$\text{for } V_{e100} = \frac{A_0 + A_1}{2} \cdot \frac{100}{27} = \frac{50 A_0}{27} + \frac{50 A_1}{27}$$

$$V_{e100} = S_0 + S_1 \quad (187)$$

260. When l is less than 100,

$$V_{el} = (S_0 + S_1) \frac{l}{100} \quad (188)$$

For level sections $h_l = h_r = c$

$$h_l + h_r - 2c = 0$$

and the formula

$$S = L + K(h_l + h_r - 2c)$$

$$\text{becomes } S = L \quad (189)$$

for level sections, and the quantities for any given values of c can be directly taken from column L without any correction from column K .

In preliminary estimates, or wherever center heights only are used, such tables are rapidly used.

261. Tables may be found in Allen's Tables XXXII for various bases for

$b = 20$	$s = 1\frac{1}{2}$ to 1	p. 252
$b = 14$	$s = 1\frac{1}{2}$ to 1	p. 248

An example will illustrate their use,

$$b = 14 \quad s = 1\frac{1}{2} \text{ to } 1$$

Notes : —

Sta. 1	$\frac{16.0}{-6.0}$	- 3.7	$\frac{12.4}{-3.6}$
0	$\frac{10.6}{-2.4}$	- 2.5	$\frac{10.3}{-2.2}$

Calculations : —

$$\begin{array}{rcl}
 3.7 & L = 134.0 & K = 11.6 \quad h_l + h_r = 9.6 \\
 & + 25.5 & \quad \quad \quad 2c = 7.4 \\
 S_1 = 159.5 & & \quad \quad \quad + 2.2 \\
 & & \quad \quad \quad \frac{2.2}{2.32} \\
 & & \quad \quad \quad \frac{23.2}{25.52}
 \end{array}$$

$$\begin{array}{rcl}
 2.5 & L = 82.2 & K = 10.0 \quad h_l + h_r = 4.6 \\
 & - 4.0 & \quad \quad \quad 2c = 5.0 \\
 S_0 = 78.2 & & \quad \quad \quad - 0.4 \\
 & & \quad \quad \quad \frac{0.4}{4.00}
 \end{array}$$

$$V_{100} = S_1 + S_0 = 237.7$$

262. There is also in Allen's Tables XXXI a "Table of Prismoidal Correction" calculated by the formula

$$C = \frac{1}{3.24}(c_0 - c_1)(D_0 - D_1)$$

In the example above

$$c_0 - c_1 = 2.5 - 3.7 = -1.2$$

$$D_0 - D_1 = 20.9 - 28.4 = -7.5$$

From Table find opp. 7.5 for 1 2.31

$$\begin{array}{rcl}
 V_{100} = V_e = 237.7 & 2 & \frac{4.63(10)}{0.46} \\
 C = 2.8 & 0.2 & \frac{0.46}{2.77} \\
 V_p = 234.9 & & C = 2.77
 \end{array}$$

263. When the section is less than 100 ft. in length, the prismoidal correction is made before multiplying by $\frac{l}{100}$

that is,
$$V_{pt} = (S_0 + S_1 + C) \frac{l}{100} \quad (190)$$

264. Equivalent Level Sections.

The Table of p. 179 (or Table XXXII, Allen's Tables) shows in the L column the value of $S = \frac{50}{27} A$ for values of center height c . Conversely if there be given the S of any section, "irregular" or "regular three level," the value of c for a level section of the same area may be found from the L column.

Example. From p. 180, Base 14, Slope $1\frac{1}{2}$ to 1 for

$$S_1 = 159.5 \quad c = 4.2 \quad \text{from Table XXXII}$$

The notes of this section will be

$$\begin{array}{ccc} \frac{13.3}{-4.2} & -4.2 & \frac{13.3}{-4.2} \end{array}$$

265. For general calculations adapted both to regular "Three-Level Sections" and to "Irregular Sections," tables can be calculated upon the following principles and formulas:—

These tables are, in effect, tables of "Triangular Prisms," in which, having given (in feet) the base B and altitude a of any triangle, the tables give the solidity (in cubic yards) for a prism of length $l = 50$; that is,

$$S = \frac{aB}{2} \cdot \frac{50}{27} = \frac{50}{54} aB \quad (191)$$

Whenever the calculations can be brought into the form $S = \frac{50}{54} aB$, the result can be taken directly from the table.

266. In Allen's Field and Office Tables, "Three-Level Sections" are provided for in Table XXXII for slope of $1\frac{1}{2}$ to 1 and bases 14 to 30. "Prismoidal Corrections" are found in Table XXXI; and "Triangular Prisms" in Table XXX.

267. In the tables the formula $S = \frac{50}{54} aB$ takes form thus, $S = \frac{50}{54} \times \text{width} \times \text{height}$, and the tables are arranged as below.

	HEIGHTS.
WIDTHS	$\frac{50}{54} \text{width} \times \text{height}$

The application to "Three-Level Sections" is as follows:—
We have formula (162), p. 151,

$$A = \left(c + \frac{b}{2s} \right) \frac{D}{2} - \frac{b^2}{4s}$$

and for a prism 50 ft. in length ($l = 50$)

$$S = \frac{50}{27} A = \frac{50}{54} \left(c + \frac{b}{2s} \right) D - \frac{50}{54} \cdot \frac{b}{2s} \cdot b \quad (192)$$

or S is the sum of two quantities, each of which is in proper form for the use of the tables.

For cross-sections of a given base and slope (b and s constants), $\frac{b}{2s}$ is a constant, and also $\frac{50}{54} \cdot \frac{b}{2s} \cdot b$ is constant.

We may then calculate once for all $\frac{b}{2s}$, and call this B (a constant).

Also $\frac{50}{54} \cdot \frac{b}{2s} \cdot b$, and call this a constant E .

Then
$$S = \frac{50}{54} (c + B) D - E$$

In using the tables, $c + B = \text{height}$

$$D = \text{width}$$

As in the previous tables, having found S_0 and S_1 ,

$$V_{100} = S_0 + S_1$$

and

$$V_i = (S_0 + S_1) \frac{l}{100}$$

268. Example. Allen's Tables XXX.

Notes :—

Sta. 1	$\frac{9.1}{- 2.4}$	— 1.2	$\frac{7.3}{- 1.2}$
--------	---------------------	-------	---------------------

Sta. 0	$\frac{8.8}{- 2.2}$	— 0.7	$\frac{6.4}{- 0.6}$
--------	---------------------	-------	---------------------

$$b = 11$$

$$s = 1\frac{1}{2} \text{ to } 1$$

$$\frac{b}{2s} = 3.7 = B$$

Grade triangle, $\frac{50}{54} \times 3.7 \times 11$

Under height 3.7, find	1 = 3.43	10. = 34.3	
	1 = 3.43	1. = $\frac{3.4}{-}$	
		$E = 37.7$	

Station 1. $c = 1.2$
 $B = \frac{3.7}{-}$
 height = 4.9

$$D = 9.1 + 7.3 = 16.4$$

Under height 4.9, find	1 = 4.54	10. = 45.4	
	6 = 27.22	6. = 27.2	
	4 = 18.15	.4 = $\frac{1.8}{-}$	
		74.4	
		$E = 37.7$	
		$S_1 = 36.7$	

Station 0. $c = 0.7$
 $B = \frac{3.7}{-}$
 height = 4.4

$$D = 8.8 + 6.4 = 15.2$$

Under height 4.4, find	1 = 4.07	10. = 40.7	
	5 = 20.37	5. = 20.4	
	2 = 8.15	.2 = $\frac{0.8}{-}$	
		61.9	
		$E = 37.7$	
		$S_0 = 24.2$	

$$V = S_1 + S_0 = 60.9$$

269. Irregular Sections.

An "Irregular Section" can be divided into triangular parts, as in the figure. Taking generally two triangular parts together for purposes of calculation, we have

$$A_1 = \frac{h_i \times (AG - d_H)}{2}$$

$$s_1 = \frac{50}{54} h_i (AG - d_H)$$

$$A_2 = \frac{h_H \times (d_i - d_l)}{2}$$

$$s_2 = \frac{50}{54} h_H (d_i - d_l)$$

$$A_3 = \frac{h_l \times (d_H - 0)}{2}$$

$$s_3 = \frac{50}{54} h_l d_H$$

$$A_4 = \frac{c \times (d_l + d_L)}{2}$$

$$s_4 = \frac{50}{54} c (d_l + d_L)$$

$$A_5 = \frac{h_L \times (d_P - 0)}{2}$$

$$s_5 = \frac{50}{54} h_L d_P$$

$$A_6 = \frac{h_P \times (d_B - d_L)}{2}$$

$$s_6 = \frac{50}{54} h_P (d_B - d_L)$$

$$A_7 = \frac{h_B \times (d_r - d_P)}{2}$$

$$s_7 = \frac{50}{54} h_B (d_r - d_P)$$

$$S = s_1 + s_2 + s_3 + s_4 + s_5 + s_6 + s_7, \quad (193)$$

$$V_{100} = S_0 + S_1$$

$$V_t = (S_0 + S_1) \frac{l}{100}$$

The calculation of Irregular Sections in rough country becomes very laborious unless the best methods are used, and this process should be thoroughly understood.

CHAPTER XV.

EARTHWORK DIAGRAMS.

270. Computations of earthwork may also be made by means of diagrams from which results may be read by inspection merely.

The principle of their construction is explained as follows:—
Given an equation containing three variable quantities as

$$x = zy \tag{194}$$

If we assume some value of z (making z a constant), the equation then becomes the equation of a right line.

If this line be platted, using rectangular coördinates (as the line $z = 1$ in the figure), then having given any value of y , the

corresponding value of x may be taken off by scale. If a new value of z be assumed, the equation is obtained of a new line which may also be platted (as $z = \frac{1}{2}$ in the figure), and from which also, having given any value of y , the corresponding value of x may be determined by scale. Assuming a series of values of z and platting, we have a series of lines, each representing a different value of z ,

and from any one of which, having given a value of y , we may by scale determine the value of x .

Thus, *given*, values of z and y ; *required*, x , we may find,

1. The line corresponding to the given value of z , and
2. Upon this line we may find the value of x corresponding to the given value of y .

271. Next, if instead of platting upon *lines* as coördinate axes, we plat upon cross-section paper, the cross-section lines form a scale, so that the values of x and y need not be *scaled*, but may be *read* by simple inspection as in the figure.

272. If the equation be in the form

$$x = azy \quad (195)$$

the same procedure is equally possible, and the line representing any value of z will still be a right line.

If the equation be in the form

$$x = a(z + b)(y + c) + d \quad (196)$$

in which a , b , c , d , are constants, the same procedure is still possible, and the line representing a given value of z is a right line, as before.

The use of diagrams of this sort is therefore possible for the solution of equations in the form of

$$x = a(z + b)(y + c) + d$$

or in simpler modifications of this form.

273. Referring again to the figure above, we may consider the horizontal lines to represent successive values of x and refer to them as the lines

$$x = 0 ; x = 1 ; x = 2, \text{ etc.}$$

and similarly we may refer to vertical lines as the lines

$$y = 0 ; y = 1 ; y = 2, \text{ etc.}$$

just as we refer to the inclined lines

$$z = \frac{1}{2} ; z = 1, \text{ etc.}$$

Having given any two of the quantities x , y , z , the third may be found by inspection from the diagram by a process similar to that described.

274. Diagram for Prismoidal Correction.

Formula
$$C = \frac{1}{3.24} (c_0 - c_1)(D_0 - D_1) \quad (168)$$

This has the form $x = a \times z \times y$

Construction of diagram.

Assume (as we did for z), a series of values of

$$c_0 - c_1 = 0, 1, 2, 3, 4, 5, \text{ etc.}$$

When $c_0 - c_1 = 0$ then $C = 0$
or, the line $c_0 - c_1$ coincides with the line $C = 0$.

When $c_0 - c_1 = 1$, the equation of the line $c_0 - c_1$ is

$$C = \frac{1}{3.24} (D_0 - D_1)$$

To plat this right line, we must find two or more points on the line. For the reason that cross-section paper is generally warped somewhat, it is best to take a number of points not more than 3 or 4 inches apart, in order to get the lines sufficiently exact. For convenience, take values of $D_0 - D_1$ as follows:—

When
$$(c_0 - c_1) = 1$$

take $D_0 - D_1 = 0, 3.24, 6.48, 9.72, 12.96, 16.20, \text{ etc.}$

then $C = 0, 1, 2, 3, 4, 5, \text{ etc.}$

When $c_0 - c_1 = 2$, the equation of the line $c_0 - c_1$ is

$$C = \frac{1}{3.24} \cdot 2(D_0 - D_1)$$

Therefore when
$$c_0 - c_1 = 2$$

take $D_0 - D_1 = 0, 3.24, 6.48, 9.72, 12.96, 16.20, \text{ etc.}$

then $C = 0, 2, 4, 6, 8, 10, \text{ etc.}$

275. In like manner a table may be constructed.

	0	3.24	6.48	9.72	12.96	16.20	19.44	22.68	25.92	$D_0 - D_1$
0	0	0	0	0	0	0	0	0	0	
1	0	1	2	3	4	5	6	7	8	
2	0	2	4	6	8	10	12	14	16	
3	0	3	6	9	12	15	18	21	24	
4	0	4	8	12	16	20	24	28	32	
5	0	5	10	15	20	25	30	35	40	
6	0	6	12	18	24	30	36	42	48	
7	0	7	14	21	28	35	42	49	56	
8	0	8	16	24	32	40	48	56	64	
9	0	9	18	27	36	45	54	63	72	
10	0	10	20	30	40	50	60	70	80	
$c_0 - c_1$										

276. It will be noticed that when $D_0 - D_1 = 0$, $C = 0$.

Therefore for all values of $c_0 - c_1$, the lines pass through the origin.

We may proceed to plat the lines $c_0 - c_1 = 1$, $c_0 - c_1 = 2$, $c_0 - c_1 = 3$, etc., from data shown in the above table, platting upon the lines $D_0 - D_1 = 3.24$, $D_0 - D_1 = 6.48$, etc., the points shown with circles around them in the cross-section sheet, p. 189.

Having the lines $c_0 - c_1 = 1$, $c_0 - c_1 = 2$, 3, platted, intermediate lines are interpolated mechanically upon the principle that *vertical* lines would be proportionally divided (as ML is proportionally divided into 5 equal parts), and points are marked for the lines

$$c_0 - c_1 = 1.2, \quad 1.4, \quad 1.6, \quad 1.8$$

For the most convenient use, the values of $c_0 - c_1$ are taken to every second tenth of a foot in interpolating, as is shown on the diagram, p. 189, between 1 and 2; that is,

$$1.2, \quad 1.4, \quad 1.6, \quad 1.8$$

A complete diagram is shown at the back of the book.

277. For Use.

Find the diagonal line corresponding to the given value of $c_0 - c_1$; follow this up until the vertical line representing the given value of $D_0 - D_1$ is reached, and the intersection is thus found. Then read off the value of C corresponding to this intersection.

Example. $c_0 - c_1 = 1.2$

$D_0 - D_1 = 11.0$

$C = 4.0$

again, $c_0 - c_1 = 1.7$

$D_0 - D_1 = 7.0$

$C = 3.6 \pm$

278. Diagram for Triangular Prisms.

From formula (191), $S = \frac{50}{54} cD$, a table may be constructed.

	0	5.4	10.8	16.2	21.6	27.0	D
0	0	0	0	0	0	0	
1	0	5	10	15	20	25	
2	0	10	20	30	40	50	
3	0	15	30	45	60	75	
4	0	20	40	60	80	100	
5	0	25	50	75	100	125	
6	0	30	60	90	120	150	
7	0	35	70	105	140	175	
8	0	40	80	120	160	200	
9	0	45	90	135	180	225	
10	0	50	100	150	200	250	
c							

From this a diagram can be constructed similar in form to that for Prismoidal Correction.

The lines for all values of c pass through the origin.

In constructing this table, any values of D might have been taken instead of those used here. Those used were selected because they give results simple in value, easily obtained, and readily platted.

279. Diagram for Three-Level Sections.

$$\text{Formula, } S = \frac{50}{54} \left(c + \frac{b}{2s} \right) D - \frac{50}{54} \cdot \frac{b}{2s} \cdot b \quad (192)$$

A separate diagram will be required for each value (or combination of values) of b and s . Since b and s thus become constants, the formula assumes the form of

$$x = a(z + b)y + d \quad (197)$$

and the diagram will consist of a series of right lines.

A table can be made up by taking successive values of $c = 0, 1, 2, 3, 4$, etc., and finding for each of these the value of S corresponding to different values of D , using the above formula.

To make separate and complete computations directly by formula would be quite laborious; there is, however, a method of systematizing the construction of the *table* which can be shown better by example than in any other way.

$$\text{280. Example. } b = 14 \quad s = 1\frac{1}{2} \text{ to } 1$$

$$\text{Formula } S = \frac{50}{54} \left(c + \frac{b}{2s} \right) D - \frac{50}{54} \cdot \frac{b}{2s} \cdot b$$

$$\text{becomes } S = \frac{50}{54} \left(c + \frac{14}{3} \right) D - \frac{50}{54} \cdot \frac{14}{3} \cdot 14$$

$$S = \frac{50}{54} \left(c + \frac{14}{3} \right) D - 60.49 \quad (198)$$

A table has been prepared for successive values of

$$c = 0, \quad 1, \quad 2, \quad 3, \quad 4, \quad 5, \quad \text{etc.}$$

$$\text{and for } D = 14, \quad 16.2, \quad 21.6, \quad 27.0, \quad \text{etc.}$$

These values of D are selected for the following reasons: $D = 14$ is the least possible value; $D = 16.2, 21.6$ are desirable because they are multiples of 5.4, and the factors in the formula show that the computations will be simplified by selecting multiples of 5.4 for the successive values of D .

	14	16.2	21.6	27.0	32.4	37.8	43.2	D
	12.963	15.	20.	25.	30.	35.	40.	Const. diff.
0	0	9.51	32.84	56.18	79.51	102.84	126.18	
1	12.963	24.51	52.84	81.18	109.51	137.84	166.18	
2	25.926	39.51	72.84	106.18	139.51	172.84	206.18	
3	38.889	54.51	92.84	131.18	169.51	207.84	246.18	
4	51.852	69.51	112.84	156.18	199.51	242.84	286.18	
5	64.815	84.51	132.84	181.18	229.51	277.84	326.18	
6	77.778	99.51	152.84	206.18	259.51	312.84	366.18	
7	90.741	114.51	172.84	231.18	289.51	347.84	406.18	
8	103.704	129.51	192.84	256.18	319.51	382.84	446.18	
9	116.667	144.51	212.84	281.18	349.51	417.84	486.18	
10	129.630	159.51	232.84	306.18	379.51	452.84	526.18	
c								

When $c = 0$ $S = \frac{50}{54} \cdot \frac{14}{3} \cdot D - 60.49$

When $D = 14$ $S = \frac{50}{54} \cdot \frac{14}{3} \cdot 14 - 60.49$
 $= 60.49 - 60.49 = 0$

When $D = 16.2$

we may again calculate directly

$$S = \frac{50}{54} \cdot \frac{14}{3} \cdot 16.2 - 60.49$$

but a better method is to find how much greater S will be for $D = 16.2$ than for $D = 14.0$.

We have $S = \frac{50}{54} \cdot \frac{14}{3} \cdot D - 60.49$

Then for any new value D'

$$S' = \frac{50}{54} \cdot \frac{14}{3} \cdot D' - 60.49$$

$$S' - S = \frac{50}{54} \cdot \frac{14}{3} (D' - D) \quad (199)$$

for $D' = 16.2$ $D = 14.0$ $D' - D = 2.2$

$$S' - S = \frac{50}{54} \cdot \frac{14}{3} \times 2.2 = 9.51$$

$$S = 0$$

$$S' = 9.51, \text{ which is entered in table.}$$

Similarly, $S'' - S' = \frac{5.0}{5.4} \cdot \frac{1.4}{3} (D'' - D')$

$$D'' = 21.6 \quad D' = 16.2 \quad D'' - D' = 5.4$$

$$S'' - S' = \frac{5.0}{5.4} \times \frac{1.4}{3} \times 5.4$$

$$= 23.333$$

$$S' = \underline{9.51} \quad S^{\text{iv}} = 79.509$$

$$S'' = \underline{32.843} \quad \underline{23.333}$$

Similarly, $S''' - S'' = \underline{23.333} \quad S^{\text{v}} = 102.842$

$$S''' = \underline{56.176} \quad \underline{23.333}$$

$$S^{\text{iv}} - S''' = \underline{23.333} \quad S^{\text{vi}} = 126.175$$

$$S^{\text{iv}} = \underline{79.509}$$

Constant increment for $D' - D = 5.4$ is 23.333.

281. Each result is entered in the table in its proper place.

The final result for $c = 0$ and $D = 43.2$ should be calculated independently as a check.

When $c = 0 \quad S = \frac{5.0}{5.4} \cdot \frac{1.4}{3} \cdot D - 60.49$

When $D = 43.2 \quad S = \frac{5.0}{5.4} \cdot \frac{1.4}{3} \times 43.2 - 60.49$

$$= 50 \times \frac{1.4}{3} \times 0.8 - 60.49$$

$$= \underline{\frac{56.0}{3}} - 60.49$$

$$= 186.67 - 60.49$$

$$S = 126.18$$

This checks exactly, and all intermediate values are checked by this process, which is also more rapid than an independent calculation for each value of D .

282. We now have values of S for the various values of $D = 14.0, 16.2, 21.6$, etc., when $c = 0$.

Next, find how much these will be increased when $c = 1$.

Formula $S = \frac{5.0}{5.4} (c + \frac{1.4}{3}) D - 60.49$

for any new value c' $S' = \frac{5.0}{5.4} (c' + \frac{1.4}{3}) D - 60.49$

$$S' - S = \frac{5.0}{5.4} (c' - c) D \quad (200)$$

When $c' = 1$ and $c = 0$, $c' - c = 1$

$$S' - S = \frac{5.0}{54} D$$

Similarly, $S'' - S' = \frac{5.0}{54} (c'' - c') D$

When $c'' = 2$ and $c' = 1$, $c'' - c' = 1$

$$S'' - S' = \frac{5.0}{54} D$$

That is, for *any increase* of 1 ft. in the value of c ,

$$S' - S = \frac{5.0}{54} D \quad (201)$$

When $D = 14$

$$S' - S = \frac{5.0}{54} \times 14 = 12.963$$

This we enter as the constant difference for column $D = 14$.

We have already found

$$\begin{aligned} S_0 &= 0 \\ &\quad 12.963 \\ S_1 &= 12.963 \\ &\quad 12.963 \\ S_2 &= 25.926 \end{aligned}$$

This gives column 14. $S_3 = 38.889$ etc.

When $D = 16.2$

$$\begin{aligned} (201) \quad S' - S &= \frac{5.0}{54} D = \frac{5.0}{54} \times 16.2 = 50 \times 0.3 \\ &= 15 \end{aligned}$$

Enter 15 as the constant difference in column 16.2.

We already have

$$\begin{aligned} S_0 &= 9.51 \\ &\quad 15. \\ S_1 &= 24.51 \\ &\quad 15. \\ S_2 &= 39.51 \end{aligned}$$

This allows us to complete column 16.2. $S_3 = 54.51$ etc.

Similarly for $D = 21.6$ $S' - S = 20$

Enter 20 as constant difference in column 21.6, and complete column as shown in table.

Similarly, fill out all the columns shown in the table.

283. The final result for $c = 10$, $D = 43.2$ should be calculated independently, and directly from the formula, as a check,

$$S = \frac{50}{3} (c + \frac{14}{3}) D - 60.49$$

$$c = 10 \quad D = 43.2$$

$$S = \frac{50}{3} \times 14.667 \times 43.2 - 60.49$$

$$= 50 \times 14.667 \times 0.8 - 60.49$$

$$= 40 \times 14.667 - 60.49$$

$$= 586.68 - 60.49$$

$$S = 526.19$$

The table gives 526.18. This checks sufficiently close to indicate that no error has been made. It would yield an exact check if we took $c + \frac{14}{3} = 14.6667$.

284. Note that for $c = 10$ $D = 43.2$ value = 526.18

$c = 10$ $D = 37.8$ " 452.84

Diff. = 73.34

Between $c = 10$ $D = 37.8$ } Diff. = 73.33
and $c = 10$ $D = 32.4$ }

In line $c = 10$ a constant difference is found between successive values of D differing by 5.4. This may be demonstrated to be = 73.33.

All values in the table except column 14 are satisfactorily checked by applying this difference of 73.33 in line 10 together with the independent check of $c = 10$, $D = 43.2$.

The value of $c = 10$, $D = 14$ can also be checked and shown to be correct.

285. Having the table, page 192, completed, the construction of the diagram is simple.

The "Diagram for Three-Level Sections, Base 14, Slope $1\frac{1}{2}$ to 1," was calculated and constructed according to this table. The Diagram given shows a general arrangement of lines and figures convenient for use. For rapid and convenient use, the diagram should be constructed upon cross-section paper, Plate G; and in this case the diagram will be upon a scale twice that of the diagram accompanying these notes.

A "curve of level section" has been platted on this diagram in the following manner. For level sections, when

$c = 0$	$D = 14.0$	$c = 2$	$D = 20.0$
$c = 1$	$D = 17.0$	$c = 6$	$D = 32.0$
$c = 1.4$	$D = 18.2$ etc.		

The line passing through these points gives the "curve of level section."

Aside from the direct use of this curve of level section (for preliminary estimates or otherwise), it is very useful in tending to prevent any gross errors in the use of the table, since, in general, the points (intersections) used in the diagram will lie not far from the curve of level section.

286. Use of Diagram.

Find the diagonal line corresponding to the given value of c ; follow this up until the vertical line representing the given value of D is reached, and this intersection found. Then read off the value of S corresponding to this intersection.

Example. Notes.

Sta. 1	$\frac{16.0}{-6.0}$	-3.7	$\frac{12.4}{-3.6}$	$S_1 = 160.$
Sta. 0	$\frac{10.6}{-2.4}$	-2.5	$\frac{10.3}{-2.2}$	$S_0 = 78.$ $V = 238.$

For Sta. 1 $c = 3.7$ $D = 28.4$

$c = 3.7$ is the middle of the space between 3.6 and 3.8.

Follow this up until the vertical line 28.4 is reached.

The intersection lies upon the line $S_1 = 160.$

Enter this above opposite Sta. 1.

For Sta. 0 $c = 2.5$ $D = 20.9$

$c = 2.5$ is the middle of space between 2.4 and 2.6.

Follow this up until the middle of space between 20.8 and 21.0 is reached.

The intersection lies just above the line

$$S_0 = 78$$

Enter this opposite Sta. 0.

$$\begin{aligned} V_{100} &= S_1 + S_0 \\ &= 160 + 78 = 238 \text{ cu. yds.} \end{aligned}$$

The prismoidal correction may be applied if desired.

287. Diagrams may be constructed in this way that will give results to a greater degree of precision than is warranted by the precision reached in taking the measurements on the ground.

In point of rapidity *diagrams are much more rapid than tables* for the computation of *Three-Level Sections*.

For "*Triangular Prisms*" and for *Prismoidal Correction*, the *diagrams are somewhat more rapid*.

For *Level Sections*, the tables for *Three-Level Sections* are *at least equally rapid*.

288. The use of approximate methods for applying the prismoidal correction to irregular sections will now be rendered very practicable by the use of these "Diagrams for 'Three-Level Sections'."

Method 1. No use of diagrams is necessary.

Method 2. Having found for any irregular sections (by triangular prisms or any other method) the solidity S for 50 ft. in length, find upon the diagram the line corresponding to this value of S ; follow this line to the curve of level section, and read off the value of c (for a level section) which corresponds, and also the value of D for the same section.

Method 3. Having found in any way the value of S ; if c is given, find the value of D to correspond; if D is given, find the value of c to correspond.

Method 4. The use of diagrams is not needed.

The diagrams shown at the back of the book are given partly to show a good scheme or arrangement, and partly to allow practice in their use. For regular work the scale is too small to be desirable, and trying to the eyes. They are not sufficiently extensive. In offices where there is much earthwork computation to be done, diagrams should be constructed on double the scale and extending to higher numbers. Several sheets may be required for each kind of diagram. It may seem that sufficiently precise values cannot be read from these diagrams, but the diagrams are much more precise than the field-work, where a center cut is not sure to one tenth of a foot.

CHAPTER XVI.

HAUL.

289. When material from excavation is hauled to be placed in embankment, it is customary to pay to the contractor a certain sum for every cubic yard hauled. Oftentimes it is provided that no payment shall be made for material hauled less than a specified distance. In the east a common limit of "free haul" is 1000 ft. Often in the west 500 ft. is the limit of "free haul." Sometimes 100 ft. is the limit.

A common custom is to make the unit for payment of haul, one yard hauled 100 ft. ; the price paid will often be from 1 to 2 cents per cubic yard hauled 100 ft.

The price paid for "haul" is small, and therefore the standard of precision in calculation need not be quite as fine as in the calculation of the quantities of earthwork. The total "haul" will be the product of

- (1) the total amount of excavation hauled, and
- (2) the average length of haul.

290. The average length of haul is the distance between the center of gravity of the material as found in excavation, and the center of gravity as deposited. It would not, in general, be simple to find the center of gravity of the entire mass of excavation hauled, and the most convenient way is to take each section of earthwork by itself. The "haul" for each section is the product of the

- (1) number of cubic yards in that section, and
- (2) distance between the center of gravity in excavation, and the center of gravity as deposited.

291. When excavation is placed in embankment, there may be some difficulty in determining just where any given section of excavation will be placed, and where its center of gravity will be in embankment.

In hauling excavation in embankment, there is some plane, as indicated by AB, to which all excavation must be hauled on its way to be placed in embankment, and (another way of putting it) *from* which all material placed in embankment must be hauled on its way from excavation. We may figure the total haul as the sum of

- (1) total "haul" of excavation *to* AB, and
- (2) total "haul" of embankment *from* AB.

The total "haul" of excavation *to* AB and the total "haul" of embankment *from* AB will most conveniently be calculated as the sum of the hauls of the several sections of earthwork. For each section the haul is the product of

- (1) the volume V of that section, and
- (2) distance from center of gravity of that section to the plane AB.

292. When the two end areas are equal, the center of gravity will be midway between the two end planes. When the two end areas are not equal in value, the center of gravity of the section will be at a certain distance from the mid-section, as shown by the formula

$$x_g = \frac{l^2}{12} \cdot \frac{A_1 - A_0}{V}$$

in which x_g = distance of center of gravity from mid-section.

293. Referring to the figure below, and following the same general method of demonstration used previously, § 235,

let $b_0 =$ base $= A_0B_0$

$b_1 =$ " $= A_1B_1$

$c_0 =$ center ht. $= O_0G_0$

$c_1 =$ center ht. $= O_1G_1$

$l =$ length (altitude)

of section $= G_0G_1$

$A_0 =$ area of $D_0A_0B_0E_0$

$A_1 =$ area of $D_1A_1B_1E_1$

$V =$ volume

Also use notation b_x , c_x , A_x for a section distant x from G_1 .

Find the distance of the center of gravity from $A_1B_1E_1D_1$, and let this $= x_c$. Let $x_g =$ distance of center of gravity from mid-section.

Then for any elementary section of thickness dx and distance x from $A_1B_1E_1D_1$, its moment will be

$$\left[b_1 + (b_0 - b_1) \frac{x}{l} \right] \left[c_1 + (c_0 - c_1) \frac{x}{l} \right] x dx$$

$$V \cdot x_c = \int_0^l \left[b_1 + (b_0 - b_1) \frac{x}{l} \right] \left[c_1 + (c_0 - c_1) \frac{x}{l} \right] x dx$$

$$V \cdot x_c = \frac{b_1 c_1 l^2}{2} + \frac{b_1 (c_0 - c_1) l^3}{3 l} + \frac{c_1 (b_0 - b_1) l^3}{3 l} + \frac{(c_0 - c_1) (b_0 - b_1) l^4}{4 l^2}$$

$$= \frac{l^2}{12} \left[\begin{array}{l} 6 b_1 c_1 + 4 b_1 c_0 + 4 b_0 c_1 + 3 b_0 c_0 \\ - 4 b_1 c_1 - 3 b_1 c_0 - 3 b_0 c_1 \\ - 4 b_1 c_1 \\ + 3 b_1 c_1 \end{array} \right]$$

$$V \cdot x_c = \frac{l^2}{12} \times (b_1 c_1 + b_1 c_0 + b_0 c_1 + 3 b_0 c_0)$$

$$x_c = \frac{l^2}{12} \times \frac{b_1 c_1 + b_1 c_0 + b_0 c_1 + 3 b_0 c_0}{V} \quad (202)$$

What is wanted is x_g rather than x_e .

$$x_g = \frac{l}{2} - x_e$$

$$Vx_g = V\frac{l}{2} - Vx_e$$

$$V = \frac{l}{6} (2b_1c_1 + 2b_0c_0 + b_1c_0 + b_0c_1) \quad \text{from (164)}$$

$$V \cdot \frac{l}{2} = \frac{l^2}{12} (2b_1c_1 + 2b_0c_0 + b_1c_0 + b_0c_1) \quad (203)$$

$$V \cdot x_e = \frac{l^2}{12} (b_1c_1 + 3b_0c_0 + b_1c_0 + b_0c_1)$$

$$V \cdot x_g = \frac{l^2}{12} (b_1c_1 - b_0c_0)$$

$$= \frac{l^2}{12} (A_1 - A_0)$$

$$x_g = \frac{l^2}{12} \cdot \frac{A_1 - A_0}{V} \quad (V \text{ in cu. ft.}) \quad (204)$$

$$x_g = \frac{l^2}{12 \times 27} \cdot \frac{A_1 - A_0}{V} \quad (V \text{ in cu. yds.}) \quad (205)$$

294. The formula above applies to the solid shown in the figure, which has trapezoidal ends, but it will apply also when D_0A_0 , D_1A_1 are each = 0, and therefore applies to such solids having triangular ends; and since any section of earthwork with parallel ends may be divided into a number of such solids with triangular ends, it applies to all ordinary sections of railroad earthwork, since it applies to the parts of which it is made up.

To show that in fact this formula is correct for prisms, wedges, and pyramids, use a method similar to that shown on page 155; find for each solid an expression for x_g in terms of A and l ; reduce to the form

$$x_g = \frac{l^2}{12} \cdot \frac{A_1 - A_0}{V}$$

295. The formula

$$x_g = \frac{l^2}{12 \times 27} \cdot \frac{A_1 - A_0}{V}$$

is not in form convenient for use, because we have not found the values of A_1 and A_0 , but instead have calculated directly from the tables or diagrams the values of S_1 and S_0 for 50 ft. in length, where

$$S_1 = \frac{50}{27} A_1, \text{ or } A_1 = \frac{27}{50} S_1$$

and

$$A_0 = \frac{27}{50} S_0$$

$$\text{Substituting, } x_{g100} = \frac{100 \times 100}{12 \times 27} \cdot \frac{S_1 - S_0}{V} \cdot \frac{27}{50}$$

$$x_{g100} = \frac{100}{6} \cdot \frac{S_1 - S_0}{V} \quad (206)$$

where V is the correct volume in cu. yds.

This formula is in shape convenient for use, and results correct to the nearest foot can be calculated with rapidity.

296. For a section of length l less than 100 ft.

$$\begin{aligned} x_{g_l} &= \frac{l^2}{12 \times 27} \cdot \frac{A_1 - A_0}{V_l} \\ &= \frac{l^2}{12 \times 27} \cdot \frac{A_1 - A_0}{V_{100} \times \frac{l}{100}} \\ &= \frac{100 l}{12 \times 27} \cdot \frac{A_1 - A_0}{V_{100}} \\ x_{g100} &= \frac{100 \times 100}{12 \times 27} \cdot \frac{A_1 - A_0}{V_{100}} \\ x_{g_l} &= x_{g100} \cdot \frac{l}{100} \end{aligned} \quad (207)$$

297. For a series of sections, each 100 ft., a correction may be applied to obtain the correction in haul for the entire mass.

Let X_c = dist. from A to c.g. for entire mass (approx.),

found by using for each section c.g. at $\frac{l}{2}$

H_a = approx. total haul from A = $V \times X_c$

X = true dist. to c.g. of entire mass from A

H = correct total haul = $V \times X$

$S_0 = \frac{5.0}{2.7} A_0$, $S_1 = \frac{5.0}{2.7} A_1$, $S_2 = \text{etc.}$, as taken from tables or diagrams.

When all sections are of uniform length, 100' as in figure above, the approximate total haul for the figure above

$$H_a = X_c V = \frac{100}{2} (V_a + 3 V_b + 5 V_c)$$

Correct total haul

$$H = XV = V_a \left(\frac{100}{2} - x_{ga} \right) + V_b \left(3 \frac{100}{2} + x_{gb} \right) + V_c \left(5 \frac{100}{2} - x_{gc} \right)$$

$$\begin{aligned} H_a - H &= V_a x_{ga} - V_b x_{gb} + V_c x_{gc} \\ &= \frac{100}{6} \left[V_a \frac{S_0 - S_1}{V_a} - V_b \frac{S_2 - S_1}{V_b} + V_c \frac{S_2 - S_3}{V_c} \right] \\ &= \frac{100}{6} (S_0 - S_3) \end{aligned}$$

Or for a more general form

$$H_a - H = \frac{100}{6} (S_0 - S_n) = \text{correction in total haul.} \quad (208)$$

This should be in cu. yds. hauled 100 ft.

While it is correct to apply formula (208) with the proper algebraic signs, it is simpler to compute the numerical value of $H_a - H$; then the true center of gravity of the entire mass will lie nearer to the larger of the extreme end sections than does the approximate center of gravity.

CHAPTER XVII.

MASS DIAGRAM.

298. Many questions of "haul" may be usefully treated by a graphical method which will be designated the "Mass Diagram."

The construction of the "Mass Diagram" will be more clearly understood from an example than from a general description.

Consider the earthwork shown by the profile on p. 206, consisting of alternate "cut" and "fill." To show the work of constructing the "diagram" in full, the quantities are calculated throughout, but for convenience, "level sections" are used and prismoidal correction disregarded. In actual practice, the solidities will have been calculated for the actual notes taken. Allowance should be made for the fact that earth placed in fill shrinks. The allowance to be made in column 5 of table will depend on how the work is to be handled. In column 5 opposite, it is assumed that, without changing the notes, additional material is placed in the fill to provide for shrinkage or settlement, which accords with common practice; and 5 per cent shrinkage is used here.

299. In the table, p. 205, columns 1 and 2 explain themselves. 3d column gives values of S from tables.

4th column gives values of S_{100} or S_l for each section, and with sign + for cut or - for fill.

5th column shows fills after 5 per cent shrinkage.

6th column gives the total, or the sum of solidities up to each station; and in getting this total, each + solidity is added and each - solidity is subtracted, as appears in the table from the results obtained.

Having completed the table, the next step is the construction of the "Mass Diagram," page 206. In the figure shown there, each station line is projected down, and the value from column 6, corresponding to each station, is platted to scale as an offset from the base line at that station, all + quantities above the line, and all - quantities below the line. The points thus found are joined, and the result is the "Mass Diagram."

STATION.	CENTER HEIGHTS.	SOLIDITY FOR 50' DUE TO CENTER HEIGHT (FROM TABLES).	SOLIDITY FOR SECTION.	FILLS + 5 PER CENT TO COVER SHRINKAGE	SOLIDITY TOTALS.

300. It will follow, from the methods of calculation and construction used, that the "Mass Diagram" will have the following properties, which can be understood by reference to the profile and diagram, page 206.

1. Grade points of the profile correspond to maximum and minimum points of the diagram.

2. In the diagram, ascending lines mark excavation, and descending lines embankment.

3. The difference in length between any two vertical ordinates of the diagram is the solidity between the points (stations) at which the ordinates are erected.

4. Between any two points where the diagram is intersected by any horizontal line, excavation equals embankment.

5. The area cut off by any horizontal line is the measure of the "haul" between the two points cut by that line.

301. It may be necessary to explain the latter point at somewhat greater length.

Any quantity (such as dimension, weight, or volume) is often represented graphically by a line; in a similar way, the product of two quantities (such as volume into distance, or as foot pounds) may be represented or measured by an area. In the case of a figure other than a rectangle, the value, or product measured by this area, may be found by cutting up the area by lines, and these lines may be vertical lines representing volumes or horizontal lines representing distance. The result will be the same in either case. An example will illustrate.

In the two figures let

a and b represent pounds

c " " feet

and the area of the trapezoid represent a certain number of foot pounds. The trapezoid may be resolved into rectangles by the use of a vertical line, as shown in Fig. 1, or by a horizontal line, as in Fig. 2.

In Fig. 1, the area is $a \times \frac{c}{2} + b \times \frac{c}{2}$

In Fig. 2, the area is $\frac{a+b}{2} \times c$

the result of course being the same in both cases.

302. In an entirely similar way, the area ABC (p. 208) represents the "haul" of earthwork (in cu. yds. moved 100 ft.) between A and C, and this area may be calculated by dividing it by a series of vertical lines representing solidities, as shown above G and F. That this area represents the haul between A and C may be shown as follows:—

Take any elementary solidity dS at D. Project this down upon the diagram at F, and draw the horizontal lines FG.

Between the points F and G (or between D and I), therefore, excavation equals embankment, and the mass dS must be hauled a distance FG, and the amount of "haul" on dS will be $dS \times FG$, measured by the trapezoid FG. Similarly with any other elementary dS .

The total "haul" between A and C will be measured by the sum of the series of trapezoids, or by the area ABC. This area is probably most conveniently measured by the trapezoids formed by the vertical lines representing solidities. The average length of haul will be this area divided by the total solidity (represented in this case on p. 206 by the longest vertical line, 2083).

303. The construction of the "Mass Diagram" as a series of trapezoids involves the assumption that the center of gravity of a section of earthwork lies at its mid-section, which is only approximately correct since S for the first 50 ft. will seldom be exactly the same as S for the second 50 ft. of a section 100 ft. long. If the lines joining the ends of the vertical lines be made a curved line, the assumption becomes more closely accurate, and if the area be calculated by "Simpson's Rule," or by planimeter, results closely accurate will be reached.

It will be further noticed that hill sections in the "diagram" represent haul forward on the profile, and valley sections haul backward. The mass diagram may therefore be used to indicate the methods by which the work shall be performed; whether excavation at any point shall be hauled forward or backward; and, more particularly, to show the point where backward haul shall cease and forward haul begin, as indicated in the figure, p. 208, which shows a very simple case, the cuts and fills being evenly balanced, and no haul over 900 feet, with no necessity for either borrowing or wasting.

304. In the figure, page 210, the excavation from Sta. 0 to 14 is very much in excess of embankment, and *vice versa* from Sta. 14 to 30. The mass diagram indicates a haul of nearly 3000 ft. for a large mass of earthwork, measured by the ordinate AB. It will not be economical to haul the material 3000 ft.; it is better to "waste" some of the material near Sta. 0, and to "borrow" some near Sta. 30, if this be possible, as is commonly the case.

If we draw the line CD, the cut and fill between C and D will still be equal, and the volume of cut measured by CE can be wasted, and the equal volume of fill measured by DF can be borrowed to advantage. It can be seen that there is still a haul of nearly 2000 ft. (from A to D) on the large mass of earthwork measured by GH. It is probable that it will not pay to haul the mass GH, or any part of it, as far as AD.

305. We must find the limit beyond which it is unprofitable to *haul* material rather than *borrow* and *waste*.

Let c = cost of 1 cu. yd. excavation or embankment.

h = cost of haul on 1 cu. yd. hauled 100 ft.

n = length of haul in "stations" of 100 ft. each.

Then, when 1 cu. yd. of excavation is wasted, and 1 cu. yd. of embankment is borrowed,

$$\text{cost} = 2c$$

When 1 cu. yd. of excavation is hauled into embankment,

$$\text{cost} = c + nh$$

The limit of profitable haul is reached when

$$2c = c + nh$$

or when

$$n = \frac{c}{h} \quad (209)$$

Example. When excavation or embankment is 18 cents per cu. yd., and haul is $1\frac{1}{2}$ cents,

$$n = \frac{18}{1.5} = 12 \text{ stations}$$

When

$$c = 16 \text{ and } h = 2$$

then

$$n = 8 \text{ stations}$$

306. In the former case (1200 ft. haul) we should draw in mass diagram (p. 212) the line KGL. Here KG is less than 1200 ft. The line should not be lower than G, for in that case the haul would be nearly as great as KL, or more than 1200 ft.

In the latter case (800 ft. haul) the line would be carried up to a point where $NM = 800$ ft. The masses between N and A, also C and O, can better be wasted than hauled, and the masses between M and G, also L and Z, can better be borrowed than hauled (always provided that there are suitable places at hand for borrowing and wasting).

Next, produce NM to R. The number of yards borrowed will be the same whether taken at RZ or at $MG + LZ$. That arrangement of work which gives the smallest "haul" (product of cu. yds. $\times$ distance hauled) is the best arrangement. The "haul" in one case is measured by GLRYU, and in the other by $MGU + UYR$. If MGU is less than GLRU, then it is cheaper to borrow (a) RZ rather than (b) $MG + LZ$.

In a similar way material NT and SO can be wasted more economically than NA and CO.

The most economical position for the line MR is when $MU = UR$. For ST, when $SV = VT$. For any change from these positions of MR and ST will show an increase of area representing "haul."

307. The case is often not as simple as that here given. Very often the material borrowed or wasted has to be hauled beyond the limit of "free haul." The limit beyond which it is unprofitable to haul will vary according to the length of haul on the borrowed or wasted material; the limit will, in general, be increased by the length of haul on the borrowed or wasted material. The haul on wasted or borrowed material, as NT, may be shown graphically by NTXW, where $NW = TX$ shows the length of haul, and NTXW the "haul" (mass $\times$ distance).

The mass diagram can be used also for finding the limit of "free haul" on the profile, and various applications will suggest themselves to those who become familiar with its use and the principles of its construction. Certainly one of its most important uses is in allowing "haul" and "borrow and waste" to be studied by a diagram giving a comprehensive view of the whole situation. There are few if any other available methods of accomplishing this result.

308. When material is first taken out in excavation, it generally occupies more space than was originally the case. When placed in embankment, it commonly shrinks somewhat and eventually occupies less space than originally. Wherever, from any cause, the material put into embankment will occupy more space or less space than it did in excavation, the quantities in embankment should be corrected before figuring haul or constructing a Mass Diagram, and a column should be shown for this as is done in Table p. 205.

309. Many engineers write their contracts and specifications without a clause allowing payment for "haul" or "overhaul." Nevertheless it appears that it is the more common practice to insert a clause providing for payment for overhaul. A canvass on this subject by the American Railway Engineering and Maintenance of Way Association in 1905 showed this practice to prevail in the proportion of 73 to 37. The free haul limit of 500 ft. seemed to meet with greater favor than any other.

Where an "overhaul" clause is inserted in a contract, the basis of payment has varied on different railroads. In one method, not recommended, the total haul is to be computed; from this shall be deducted for free haul the total "yardage" multiplied by the length of the free haul limit. Under this system, with a 500 ft. free haul limit, there might be 10,000 cu. yds. of earth hauled (all of it) more than 500 ft., or an average of 600 ft.; yet if there were another 10,000 cu. yds. hauled an average of 300 ft., there would be no payment whatever for overhaul; the average haul would be less than 500 ft. Unless the specifications clearly show that this method is to be used, it is unfair as well as unsatisfactory to the contractor.

What seems a logical and satisfactory provision is that recommended by the American Railway Engineering and Maintenance of Way Association by a letter ballot vote of 134 to 23 (announced in March, 1907). This is as follows:—

"No payment will be made for hauling material when the length of haul does not exceed the limit of free haul, which shall be _____ feet.

"The limits of free haul shall be determined by fixing on the profile two points, one on each side of the neutral grade point, one in excavation and the other in embankment, such that the distance between them equals the specified free haul limit, and

the included quantities of excavation and embankment balance. All haul on material beyond this free haul limit will be estimated and paid for on the basis of the following method of computation, viz.:—

“All material within this limit of free haul will be eliminated from further consideration.

“The distance between the center of gravity of the remaining mass of excavation and center of gravity of the resulting embankment, less the limit of free haul as above described, shall be the length of overhaul, and the compensation to be rendered therefor will be determined by multiplying the yardage of the remaining mass as above described, by the length of the overhaul. Payment for the same will be by units of one cubic yard hauled one hundred feet.

“When material is obtained from borrow-pits along the embankment, and runways are constructed, the haul shall be determined by the distance the team necessarily travels. The overhaul on material thus hauled shall be determined by multiplying the yardage so hauled by one half the round distance made by the team less the free haul distance. The runways will be established by the engineer.”

310. This statement as to the method of figuring overhaul is explained very simply by the Mass Diagram below. The length of AB is that of the free haul limit (500 ft. in figure). The free haul is shown in the area ACDBHA. The amount of overhaul to be paid for is shown in 2 parts, ACM, BDE.

311. The diagram on the page opposite shows a sketch of a profile and the corresponding mass diagram; illustrating further the method of studying questions of haul, borrow, and waste. For this purpose it is assumed that the limit of economical haul is 1000 ft., and the lines on the mass diagram are adjusted accordingly.

(a) Line AB = 1000 ft. and can go no lower because the limit of 1000 ft. would be exceeded; nor higher because the waste near A and the borrow near B would be increased.

(b) Line CDE is placed so that $CD = DE$; the sum of the two borrows (between B and C, and between E and F) is the same for any practical position of CDE; the sum of the two areas CRD and DSE is a minimum when $CD = DE$.

(c) Line FG = 1000 ft. and, if higher, will exceed 1000 ft. and, if lower, will increase borrow near F and waste near G.

(d) If the line HM is lowered, the borrow near H and the waste near M are decreased, but the haul is increased by trapezoidal areas of which HI, JK, and LM are their smaller bases, while it is decreased by trapezoidal areas of which IJ and KL are their larger bases. The net result is the equivalent of increasing the haul by a trapezoidal area which has an upper base of 1000 ft. and a lower base greater than 1000 ft., so that the limit of economical haul is exceeded. If the line is raised, by similar reasoning the cost of the additional borrow and waste will be greater than the saving in the haul item.

(e) Line NOPQ is placed so that $NO + PQ - QP = 1000$ ft. A change up or down will increase the cost.

(f) If the profile were continued beyond station 80, it is quite possible that the material indicated as waste could be utilized in fill, or part of it so utilized.

(g) As the profile is shown, there is a small amount of cut carried into fill close to station 80.

(h) The projections of the points A, B, C, D, etc., up to the profile, serve to show where material should be wasted, where borrowed; what material should be carried forward, what backward. The study of the mass diagram has shown that the arrangement adopted is the most economical.

The exact stations of the points A, B, C, D, etc., can be determined accurately from the cross-section notes and the volumes of earthwork already computed, if this should seem desirable.

PREFACE

It is hoped that these tables will be found more complete and perfect than those which have preceded. Among them are convenient tables for easement curves and for earthwork computation, several of which are altogether new. These include the "Cubic Spiral" easement curve, which is very simple, being arranged for a uniform chord length of 30 feet, and giving all deflection angles for a large variety of spirals; also the "Offsets from Tangent for a 10° Curve" and "Angles Proportionate to Squares of Distances," both of which are specially applicable to easement curves, but should be found useful for other purposes. The two latter allow the rapid and simple working of spirals of any length or for any set-off from the tangent.

The tables for Earthwork Computation should meet with favor. Those for regular three-level sections and for prismoidal correction are based upon tables used for computing the earthwork on many hundred miles on a prominent western railroad, and that for triangular prisms is similar in principle to that for prismoidal correction.

Other tables seldom found in books suitable for field use are "Acres for Strip 100 Feet Wide," "Metric Curves," "Velocity Heights," and "Mean Refractions in Declination," while the "Stadia Reduction Tables" are more complete than those common in field tables.

The table for "Tangent Distances for a 1° Curve" gives values for every minute up to 96° and the table of "Corrections" is full enough to render interpolation unnecessary. This will allow greater speed and the saving of much time for an entire field party.

There are many points of arrangement and typography which are intended to facilitate work or render errors less probable. Great care has been taken both in computing and proof-reading to secure absence from error. The plate-proof has been twice read under the author's direction, and other tests applied which have required the use (in adding) of every figure in the tables. The opportunity for comparison with other published tables and the running down of discrepancies has given opportunity for a high degree of accuracy, and these tables are believed to be superior in this respect.

The "Barometric Heights" are Professor Airy's and the "Stadia Reductions" are Winslow's from the "Reports of the Pennsylvania Geological Survey." The "Logarithms" and "Sines, Cosines, Tangents and Cotangents," both natural and logarithmic,

are taken from the copyrighted "Wells' Six Place Logarithmic Tables" by permission of Prof. Webster Wells and of D. C. Heath & Co., his publishers; and the Refractions in Declination," also copyrighted, from the "Manual" published by W. and L. E. Gurley, who have permitted their use. Almost, if not quite, all other tables have been calculated anew; seven place tables of logarithms and logarithmic functions have been largely used, but all numbers doubtful in the last place have been worked out by ten place tables which have necessarily been in very frequent use. No pains have been spared to make the last figure correct. The author desires to thank every one who has helped in the preparation of this book by suggestion or otherwise, and especially Mr. C. B. Breed, of the Massachusetts Institute of Technology, for frequent advice and assistance in arrangement and preparation of work; to Mr. E. S. Manson, Jr., S. M., who computed some of the most important tables, including Tables I, III, XV; to Miss V. W. Porter for very faithful and efficient work both in computations and comparisons and proof-reading; and to W. & L. E. Gurley, to D. C. Heath & Co., and to Prof. Webster Wells for their courteous permission to use their books as stated above.

These tables will be published separately and also in combination with the Author's book on "Railroad Curves and Earthwork."

July, 1903.

PREFACE TO SECOND EDITION

NEW tables have been prepared, adapted to the use of the Spiral of the Am. Ry. Eng. Ass'n, and the old tables for Spirals discontinued. A new table for finding the difference between the lengths of circular arcs and chords is specially useful for curved boundary lines, either on streets or on railroad right of way. Another addition has been the tables of split switch turnouts, both for theoretical and for practical leads, adopted as standards by the Am. Ry. Eng. Ass'n. The table for Stadia Reductions has given place to one better arranged, copyrighted by Breed and Hosmer in their book on Surveying, and used here by their permission.

C. FRANK ALLEN.

TABLE VII.C.—MINIMUM LENGTH OF EASEMENT CURVE

Limiting Curves

For all curves which are liable to limit the speed of trains, the length of spiral should equal that indicated on the line marked "Superelevation = 8 inches." Longer spirals may be used, provided the increased length does not adversely affect the degree of curve or seriously affect the cost of construction.

Minor Curves

For minor curves the length of spiral should never be less than that indicated on the diagram; an increase of about 50 per cent over the indicated length may be desirable when cost is not seriously affected.

Spirals need not be used when superelevation required for highest permissible speed is less than two inches.

TABLE XXXIII. NUMBERS AND FORMULAS.

	Symbol.	Number.	Loga- rithm.
Ratio of circumference to diameter	π	3.14159	0.497150
Area of circle (πr^2) radius = 1			
Surface of sphere (πd^2) diam. = 1			
Reciprocal of same	$\frac{1}{\pi}$	0.31831	9.502850
Area of circle ($\frac{\pi d^2}{4}$) diameter = 1 . .	$\frac{1}{4}\pi$	0.78540	9.895090
Volume of sphere ($\frac{4}{3}\pi r^3$) radius = 1 .	$\frac{4}{3}\pi$	4.18879	0.622089
Area of sector of circle (length of arc = l)	$\frac{1}{2}lr$.		
Area of segment of parabola (c = chord; m = mid. ord.)	$\frac{2}{3}cm$.		
Area of segment of circle (ap.)	$\frac{2}{3}cm$.		
Base of hyperbolic logarithms	ϵ	2.71828	0.434294
Modulus of common system of logs. = $\log \epsilon$	M	0.43429	9.637784
Reciprocal of same = hyp. log. 10. . .	$\frac{1}{M}$	2.30259	0.362216
Length of seconds pendulum at N. Y. (inches)		39.1017	1.592196
Acceleration due to gravity at New York	g	32.15949	1.507309
Cubic inches in 1 U. S. gallon		231	2.363612
Cubic inches in 1 Imperial gallon . . .		277.274	2.442909
U. S. gallons in 1 cubic foot		7.4805	0.873931
Imperial gallons in 1 cubic foot . . .		6.2321	0.794634
Feet in 1 meter		3.280833	0.515984
Inches in 1 meter		39.37	1.595165
Miles in 1 kilometer		0.62137	9.793350
Square feet in 1 square meter		10.7639	1.031968
Cubic feet in 1 cubic meter		35.3145	1.547953
Pounds (Av.) in 1 kilogram		2.20462	0.343334
Ton (2240 lbs.) in 1 tonne		0.98421	9.993086
Ft.-lbs. in 1 kilogram-meter		7.23300	0.859318
Feet in 1 mile		5280	3.722634
Square feet in 1 acre		43560	4.639088

TABLE XXXIII. NUMBERS AND FORMULAS.

SOLUTION OF RIGHT TRIANGLES.

1. $\sin A = \frac{a}{c} = \cos B$
2. $\cos A = \frac{b}{c} = \sin B$
3. $\tan A = \frac{a}{b} = \cot B$
4. $\cot A = \frac{b}{a} = \tan B$
5. $\sec A = \frac{c}{b} = \operatorname{cosec} B$
6. $\operatorname{cosec} A = \frac{c}{a} = \sec B$
7. $\operatorname{vers} A = \frac{c-b}{c} = \frac{d}{c}$
8. $\operatorname{exsec} A = \frac{e}{c}$
9. $a = c \sin A = b \tan A = c \cos B = b \cot B = \sqrt{(c+b)(c-b)}$
10. $b = c \cos A = a \cot A = c \sin B = a \tan B = \sqrt{(c+a)(c-a)}$
11. $d = c \operatorname{vers} A$
12. $e = c \operatorname{exsec} A$
13. $c = \frac{a}{\cos B} = \frac{b}{\sin B} = \frac{a}{\sin A} = \frac{b}{\cos A} = \frac{d}{\operatorname{vers} A} = \frac{e}{\operatorname{exsec} A}$

SOLUTION OF OBLIQUE TRIANGLES.

Given.	Sought.	Formulas.
14. A, B, a	b, c	$b = \frac{a}{\sin A} \cdot \sin B, \quad c = \frac{a}{\sin A} \sin (A+B)$
15. A, a, b	B, c	$\sin B = \frac{\sin A}{a} \cdot b, \quad c = \frac{a}{\sin A} \cdot \sin C.$
16. C, a, b	$A-B$	$\tan \frac{1}{2}(A-B) = \frac{a-b}{a+b} \tan \frac{1}{2}(A+B)$
17. a, b, c	A	Let $s = \frac{1}{2}(a+b+c)$; $\sin \frac{1}{2}A = \sqrt{\frac{(s-b)(s-c)}{bc}}$
18.		$\cos \frac{1}{2}A = \sqrt{\frac{s(s-a)}{bc}}; \tan \frac{1}{2}A = \sqrt{\frac{(s-b)(s-c)}{s(s-a)}}$
19.		$\sin A = \frac{2\sqrt{s(s-a)(s-b)(s-c)}}{bc};$
20.		$\operatorname{vers} A = \frac{2(s-b)(s-c)}{bc}$
21.	area	$\text{area} = \sqrt{s(s-a)(s-b)(s-c)}$
22. A, B, C, a	area	$\text{area} = \frac{a^2 \sin B \cdot \sin C}{2 \sin A}$
23. C, a, b	area	$\text{area} = \frac{1}{2} a b \sin C.$

GENERAL FORMULAS.

$$24. \sin A = 2 \sin \frac{1}{2} A \cos \frac{1}{2} A = \sqrt{1 - \cos^2 A} = \tan A \cos A$$

$$25. \cos A = 2 \cos^2 \frac{1}{2} A - 1 = 1 - 2 \sin^2 \frac{1}{2} A = \cos^2 \frac{1}{2} A - \sin^2 \frac{1}{2} A$$

$$26. \tan A = \frac{\sin A}{\cos A} = \frac{\sin 2 A}{1 + \cos 2 A}$$

$$27. \cot A = \frac{\cos A}{\sin A} = \frac{\sin 2 A}{1 - \cos 2 A} = \frac{\sin 2 A}{\text{vers } 2 A}$$

$$28. \text{vers } A = 1 - \cos A = \sin A \tan \frac{1}{2} A = 2 \sin^2 \frac{1}{2} A$$

$$29. \text{exsec } A = \sec A - 1 = \tan A \tan \frac{1}{2} A = \frac{\text{vers } A}{\cos A}$$

$$30. \sin 2 A = 2 \sin A \cos A$$

$$31. \cos 2 A = 2 \cos^2 A - 1 = \cos^2 A - \sin^2 A = 1 - 2 \sin^2 A$$

$$32. \tan 2 A = \frac{2 \tan A}{1 - \tan^2 A}$$

$$33. \cot 2 A = \frac{\cot^2 A - 1}{2 \cot A}$$

$$34. \text{vers } 2 A = 2 \sin^2 A = 2 \sin A \cos A \tan A$$

$$35. \text{exsec } 2 A = \frac{2 \tan^2 A}{1 - \tan^2 A}$$

$$36. \sin^2 A + \cos^2 A = 1$$

$$37. \sin (A \pm B) = \sin A \cdot \cos B \pm \sin B \cdot \cos A$$

$$38. \cos (A \pm B) = \cos A \cdot \cos B \mp \sin A \cdot \sin B$$

$$39. \sin A + \sin B = 2 \sin \frac{1}{2} (A + B) \cos \frac{1}{2} (A - B)$$

$$40. \sin A - \sin B = 2 \cos \frac{1}{2} (A + B) \sin \frac{1}{2} (A - B)$$

$$41. \cos A + \cos B = 2 \cos \frac{1}{2} (A + B) \cos \frac{1}{2} (A - B)$$

$$42. \cos B - \cos A = 2 \sin \frac{1}{2} (A + B) \sin \frac{1}{2} (A - B)$$

$$43. \sin^2 A - \sin^2 B = \cos^2 B - \cos^2 A = \sin (A + B) \sin (A - B)$$

$$44. \cos^2 A - \sin^2 B = \cos (A + B) \cos (A - B)$$

$$45. \tan A + \tan B = \frac{\sin (A + B)}{\cos A \cdot \cos B}$$

$$46. \tan A - \tan B = \frac{\sin (A - B)}{\cos A \cdot \cos B}$$

(191) $S = \frac{50}{54} aB$

(204) $x_g = \frac{l^2}{12} \cdot \frac{A_1 - A_0}{V} \text{ (ft.)}$

(206) $x_{g_{100}} = \frac{100}{6} \cdot \frac{S_1 - S_0}{V}$

(207) $x_{g_l} = x_{g_{100}} \cdot \frac{l}{100}$

(208) $H - H_a = \frac{100}{6} (S_o - S_n)$

EXPLANATION OF TABLES.

For all Circular Curves except Metric Curves the degree D is the central angle subtended by a chord of 100 feet.

TABLE I. The Radius is computed from the Logarithm, and the latter is in general, therefore, superior in precision. A few of the large Radii at the beginning of this table are taken from ten-place tables and are superior in precision to the corresponding Logarithms. For many computations the Logarithms are more convenient than the Radii themselves.

TABLE II. Tangent Offsets and Middle Ordinates.
These are given for chords of 100 feet.

TABLE III. } Tangent Distances for a 1° Curve.

TABLE IV. } Correction for Tangent Distances.

The intersection angle I is marked by degrees at the top and minutes at the side. The tangent distance for a curve of any specified degree is obtained by taking from Table III. the tabular number for the given intersection angle, and dividing this by the specified degree of curve. This gives a result approximately correct. The correct result may be obtained by applying from Table IV. the correction for the specified degree of curve and the given intersection angle. This correction is to be added *after dividing* by the degree of curve.

Example. Degree = 9° . Intersection angle = $60^\circ 48'$.

Tabular number = $3361.6(9 = D$.

373.51 approx. value T .

$.38$ = correction 9° and $61'$.

373.9 = correct value for Tangent
Distance.

TABLE V. External Distances for a 1° Curve.

For any specified degree, divide the tabular number by the specified degree of curve. The result is closely approximate. No table of corrections is given for this. Where definite precision is required, find result by logarithmic computation.

EXPLANATION OF TABLES.

TABLE VI. Spirals for Various Degrees of Curve.

The spiral adopted here is the Am. Ry. Eng. Ass'n spiral in which the length of spiral is the sum of ten equal chords, and in which the spiral angles vary as the squares of the lengths from the *T.S.* The Am. Ry. Eng. Ass'n has computed values of y_c , x_c , C , in terms of the length of spiral l_c . These values have been used as the fundamental basis in computing the values of y_c , x_c , q , p , and the long chord C in this table. Lengths of spiral are here given in multiples of 20 feet for various degrees of curve from 1° to 20° . The values of s_c are also given in this table. For finding the deflection angles this value of s_c is used in Table VII immediately following.

TABLE VII. Deflection Angles for Spirals.

For the values of s_c found in Table VI or by other method, the ten deflection angles to chord points are given. However the spiral may have been selected, when s_c is determined, the values of the ten deflection angles are as found in this table.

TABLE VII A. Deflection Angles from Intermediate Points on Spirals.

For any given spiral when s_c is determined the first deflection angle i_1 is found in Table VII. When the transit is at any intermediate point Table VII A gives coefficients by which i_1 is to be multiplied when sighting at any chord point (forward or backward) used either as a backsight on an established point, or as a new point to be fixed on the spiral.

Example. Spiral angle $s_c = 8^\circ 36' = 8.6^\circ$.

Table VII gives $i_1 = 0^\circ 01.72'$.

Transit at point 6

Back deflection to *T.S.* $= 01.72' \times 72 = 124'$
 $= 2^\circ 04'$

Forward deflection to point 7 $= 01.72' \times 19 = 0^\circ 33'$

8 $= 01.72' \times 40 = 1^\circ 09'$

9 $= 01.72' \times 63 = 1^\circ 48'$

S.C. 10 $= 01.72' \times 88 = 2^\circ 31'$

There is a slight approximation in these coefficients but they are correct in ordinary cases and according to the Am. Ry. Eng. Ass'n in any case "if the central angle from the transit point to the point of sight, less the included angle from the *T.S.* to the transit point does not exceed 15° ."

EXPLANATION OF TABLES.

TABLE VII B. Spirals. Coefficients of x_c , y_c , p , q .

Ordinarily the spiral will be selected from Table VI and values of p and q taken from that table. In revising line irregular values of l_c and D_c will frequently be used. Table VII B allows values of p and q to be computed with little difficulty and x_c and y_c found if needed. The value of s_c can be found by ordinary computation.

TABLE VII C. Diagram for Length of Spirals.

This diagram explains itself.

TABLE VIII. Long Chords and Actual Arcs.

The actual arc for any given number of full stations may be found by multiplying the length of arc for one station by the number of stations. Actual arcs corresponding to sub-chords may be found by finding the angle and then multiplying the radius by the value taken from Table XX.

TABLE IX. Acres for Strip 100 Feet Wide.

The fractions of acres are carried to hundredths. The "Lengths in Feet" are the limits between which the acres (or fraction of acre) apply.

Example. How many acres in 1146.97 lineal feet? 1146.97 lies between 1143.45 and 1147.81, between which we find 2.63, the required number of acres.

TABLE X. Curves for Metric System.

This is computed on the basis that the Degree of Curve equals the Deflection Angle for a chord of 20 meters, or very nearly that the Degree of Curve is the central angle subtended by a chord of 10 meters or 1 station in length. The radius, the chord, length, offset, or other linear dimensions on the metric curve will be $\frac{2}{10}$ that of U.S. curves of double the degree or nearly $\frac{1}{10}$ those of U.S. curves of the same degree. The table shows the corresponding U.S. degree for each metric curve given.

TABLE XI. Barometric Tables.

The approximate difference in heights in feet is found by taking the difference between the tabular numbers correspond-

EXPLANATION OF TABLES.

ing to the observed readings of the barometer in inches. Temperature correction is made by the formula $\frac{T + t - 100}{1000}$ which is easily computed when necessary. The corrected difference in heights $D = (H - h) \left(1 + \frac{T + t - 100}{1000} \right)$ where H and T represent barometer and thermometer readings at one station and h , t , at the other.

<i>Examples.</i>	Barometer Readings	29.83	28.17
	Thermometer	75°	62°
	Tabular number	28.17	2609
		29.83	<u>1049</u>
			1560
			1.037
Temp. corr.	=	$\frac{75 + 62 - 100}{1000}$	$\frac{1560}{6222}$
	=	$\frac{37}{1000}$	5185
			<u>1037</u>
Diff. in height	=	1618 ft.	1617.720

TABLE XII. Logarithms of Numbers.

Where there are more than four significant figures, the table of proportional parts will be found useful. The star opposite certain logarithms shows that the two figures at the left are to be taken from the line below.

Example. Required log of 6723.46.

For left 672 and top 3 the logarithm = .827563 and diff. = 65.

Table of prop. parts 65 gives	26 for 4
	<u>4 for .6</u>
	3.827593

the characteristic 3 being one less than the number of significant figures to the left of the decimal point, in 6723.46.

Example. To find number for log 2.672962

Log of 4709 = .672929

Diff. = 92; for 3 prop. part = 33

Diff. = 92; for 3 prop. part = 28

Diff. = 92; for 3 prop. part = 5.

Number is 470.935 .5 prop. part = 4.6

EXPLANATION OF TABLES.

TABLE XIII. Logarithmic Sines, Cosines, Tangents, and Cotangents.

In taking out degrees and minutes, use the minutes at the left with the degrees at the left, whether the degrees appear at top or at bottom of page; use the minutes at right in a similar way with the degrees at right. Use headings for Sin., Cos., Tan., Cot., as given at top with the degrees shown at top (whether right or left); use headings for Cos., Sin., Tan., Cot., as given at bottom with the degrees given at bottom (whether right or left). The difference for 1 second is given for every minute, and is to be multiplied by the number of seconds and the result added or subtracted.

For very small angles up to 5° , where results precise for the nearest second are required, Table XIV should be used.

TABLE XIV. Auxiliary Table for Logarithmic Sines and Tangents of Small Angles.

This table is computed upon the basis (approximately true) that the sines of small angles, or the tangents of small angles, are proportional to the angles themselves.

Example. Required $\log \sin 0^\circ 47' 12''$.

Then

$$\begin{aligned} \frac{\sin 47' 12''}{\sin 47'} &= \frac{47' 12''}{47'} \\ \sin 47' 12'' &= 47' 12'' \frac{\sin 47'}{47'} = 2832'' \frac{\sin 47'}{2820''} \\ \log \sin 47' &= 8.135810 \\ \log 2820'' &= 3.450249 \\ &\quad 4.685561 \\ \log 2832'' &= 3.452093 \\ \log \sin 47' 12'' &= 8.137654 \end{aligned}$$

This auxiliary table gives for $47'$, shown in the example above, the value of $\log \sin 47' - \log 2820'' = 4.685561$ as appears above, and for each minute in similar fashion; the number given in the table, then, is to be added to the log of the required angle (given in seconds). It should be noted that the table gives the value of every minute in seconds. As above $47' = 2820''$; whence also $47' 12'' = 2832''$.

EXPLANATION OF TABLES.

Example. Required angle whose $\log \sin = 8.325327$.

$\log \sin 1^\circ 13'$ is the nearest (Table XIII).

Required $\log \sin$	$= 8.325327$
Table XIV ($\sin$) $1^\circ 13'$	$= 4.685542$
$4363'' \log$	$= 3.639785$
or $1^\circ 12' 43''$	$=$ required angle.

Example. Required $\log \sin 3^\circ 19' 34''$.

Table XIV. value for $3^\circ 19' (\sin)$	$= 4.685332$
$3^\circ 20'$	$= 4.685330$
Interpolate tabular value for $3^\circ 19' 34''$	$= 4.685331$
Then $\log 11974''$	$= 4.078239$
$\log \sin 3^\circ 19' 34''$	$= 8.763570$

TABLE XV. Logarithmic Versed Sines and External Secants.
No explanation appears necessary.

TABLE XVI. It may be shown that $\text{vers } A = 2 \sin^2 \frac{1}{2} A$; it follows that for small angles it is approximately true that the versines of angles vary as the squares of the angles. The external secants also vary as the squares of the angles.

$$\text{Example. } \frac{\text{vers } 0^\circ 41' 17''}{\text{vers } 0^\circ 41'} = \frac{(0^\circ 41' 17'')^2}{(0^\circ 41')^2} = \frac{2477^2}{2460^2}$$

$$\text{vers } 0^\circ 41' 17'' = 2477^2 \frac{\text{vers } 0^\circ 41'}{2460^2}$$

The tabular number for $0^\circ 41' = \log \text{vers } 0^\circ 41' - \log 2460^2$.

$$\begin{aligned} &= 9.070115 \\ 2 \log 2477 &= 3.393926 \times 2 &= 6.787852 \\ \log \text{vers } 0^\circ 41' 17'' &= 5.857967 \end{aligned}$$

Example. Required angle whose $\log \text{vers} = 6.309065$.

$\log \text{vers } 1^\circ 9'$ is the nearest (Table XV.).

Required $\log \text{vers}$	$= 6.309065$
Table XVI (vers) $1^\circ 9'$	$= 9.070105$
	$7.238960(2$
$4164'' \log$	$= 3.619480$
or $1^\circ 09' 24''$	$=$ required angle

EXPLANATION OF TABLES.

Similarly for external secants of small angles.

For exsec. of 90° — small angles, it may be shown that

$$\text{exsec } A = \frac{\text{vers } A}{\cos A}$$

$$\text{exsec } 90^\circ - A = \frac{\text{vers } 90^\circ - A}{\cos 90^\circ - A} = \frac{\text{vers } 90^\circ - A}{\sin A}$$

where $\sin A$ may be taken from auxiliary tables.

TABLE XVII. } Natural Sines and Cosines.

TABLE XVIII. } Natural Tangents and Cotangents.

Use the minutes at the left with the degrees at the top, and the minutes on the right with the degrees at the bottom.

TABLE XIX. Natural Versed Sines and External Secants.

This requires no explanation.

TABLE XX. Lengths of Circular Arcs ; Radius = 1.

To find the arc for a given angle and given radius, look out the tabular number for the given degrees, also for the minutes, also for the seconds. Add these together and multiply by the radius. The result will be the length of arc.

TABLE XX A. Difference between Circular Arcs and Chords.

The table shows values for radius = 1. For any central angle, the tabular number is to be multiplied by the radius.

TABLE XXI. Squares, Cubes, Square Roots, Cube Roots, and Reciprocals.

This requires no explanation.

TABLE XXII. Turnouts and Switches.

The Frog Angles and Angles of Crotch Frog are good for any kind of turnout. The lead and length of switch rail are computed for Stub Switch only.

TABLE XXII A. } Turnouts for Split Switches.
XXII B. }

These tables are the standard tables of recommended practice of the Am. Ry. Eng. Ass'n. The combinations of frogs with switches shown in the table are a part of the standard recommended.

The table explains itself otherwise.

EXPLANATION OF TABLES.

TABLE XXIII. Velocity Heights.

These are computed by the formula $H = 0.0355 V^2$ which includes the effect due to the rotative energy of the wheels.

TABLE XXIV. Rise per Mile Various Grades.

TABLE XXV. Elevation of Outer Rail on Curves.

This table is based on the formula $e = \frac{gv^2D}{32.16 \times 5729.65}$

where

$$g = 4'8\frac{1}{2}''$$

TABLE XXVI. Inches in Decimals of a Foot.

This table requires no special explanation.

TABLE XXVII. Middle Ordinate for Curving Rails.

This table gives in common fractions of an inch the middle ordinate for various lengths of rails. This will be more convenient for use than it would be if decimal fractions were to be used.

TABLE XXVIII. Stadia Reductions, Horizontal and Vertical.

Stadia hairs are set so that the horizontal distance with the line of sight level will be 100 times the rod reading, or $100r$.

To this, however, must be added a constant c , due to the optical construction of the instrument. It is common practice to assume that $c = 1$ ft. for transits, and $c = 2$ ft. for alidades. For a level sight the horizontal distance will be $100r + 1$ for transit, and this distance $100r + 1$ is also used in computing vertical heights, when a vertical angle has been taken.

Example. Rod reading = 5.27 at $7^\circ 37'$; $c = 1$

$$100r + 1 = 528 \text{ for a transit}$$

Vertical height from Table for rod reading of 1 ft. = 13.14

For rod reading 5.27 use corrected value $5.28 \times 13.14 = 69.4$

For horizontal correction, interpolate for 528 and for $7^\circ 37'$ to nearest foot = 9

$$100r + 1 = 528$$

Horizontal distance = 519

EXPLANATION OF TABLES.

TABLE XXIX. Mean refraction in Declination.

This table is copied from W. and L. E. Gurley's Manual by permission. The hour angle indicates the distance of the sun from the meridian; for example, 2 hours indicates either 10 A.M. or 2 P.M. For one hour either before or after noon the refraction may properly be taken the same as at noon, or 0 h.

Declinations north appear as + in the table, and the refraction is to be added. Similarly, declinations south appear as -, and refractions are to be subtracted. The refractions here given are to be applied to declinations taken from the Nautical Almanac, and a sufficient record of these must be made before going into the field.

Example. Required corrected declinations Monday, Sept. 11, 1905, at New Orleans. (Lat. $29^{\circ} 57' 46''$; Long. $6^{\text{h}} 00^{\text{m}} 13.9^{\text{s}}$.)

Greenwich Mean Noon = 6 A.M. New Orleans (standard time).

Naut. Alm. gives Decl. N. or $+ 4^{\circ} 43' 16''$, Diff. for 1 hour = $0' 57''$ (subtract).

		Lat. 30°	
		Decl. $+ 5^{\circ}$	
New Orleans	Declination	Refraction	
6 A.M.	$+ 4^{\circ} 43' 16''$	for $5^{\text{h}} = 1' 52''$	
	$- 57''$	$4^{\text{h}} = 0' 52''$	
7	$4^{\circ} 42' 19''$	$+$	$1' 52'' = 4^{\circ} 44' 11''$
	$57''$		
8	$4^{\circ} 41' 22''$	$+$	$0' 52'' = 4^{\circ} 42' 14''$
9	$4^{\circ} 40' 25''$	$+$	$0' 39'' = 4^{\circ} 41' 04''$
10	$4^{\circ} 39' 28''$	$+$	$0' 31'' = 4^{\circ} 39' 59''$
11 A.M.	$4^{\circ} 38' 31''$	$+$	$0' 27'' = 4^{\circ} 38' 58''$
12 M.	$4^{\circ} 37' 34''$	$+$	$0' 27'' = 4^{\circ} 38' 01''$
1 P.M.	$4^{\circ} 36' 37''$	$+$	$0' 27'' = 4^{\circ} 37' 04''$
2	$4^{\circ} 35' 40''$	$+$	$0' 31'' = 4^{\circ} 36' 11''$
3	$4^{\circ} 34' 43''$	$+$	$0' 39'' = 4^{\circ} 35' 22''$
4	$4^{\circ} 33' 46''$	$+$	$0' 52'' = 4^{\circ} 34' 38''$
5	$4^{\circ} 32' 49''$	$+$	$1' 52'' = 4^{\circ} 34' 41''$

EXPLANATION OF TABLES.

Example. Required corrected declinations Monday, Feb. 6, 1905, at Denver. (Lat. $39^{\circ} 45' 00''$; Long. $6^{\text{h}} 59^{\text{m}} 58.2^{\text{s}}$.)

Greenwich Mean Noon = 5 A.M. Denver (standard time).

Decl. S. or $-15^{\circ} 43' 46''$ Diff. for 1 hour = $0' 46''$ (subtract).

		Lat. 40°	
		Decl. -15°	
Denver	Declination	Refraction	
5 A.M.	$-15^{\circ} 43' 46''$	for $5^{\text{h}} = 25' 18''$	
	<u>46''</u>	(not suitable to use)	
6	$15^{\circ} 43' 00''$	for $4^{\text{h}} = 3' 21''$

TABLE XXX. Triangular Prisms.

Any end area of a section of earthwork may be divided into a number of areas, each triangular in form. This table gives the solidity in cubic yards of a triangular prism 50 feet in length, the factors required for the table being the height or altitude a and the width or base B , in accordance with the formula $S = \frac{50}{2} aB$. The end area solidity for 100 feet in length, due to two different end sections, will be the sum of the two solidities for the end sections, or

$$V_{e100} = S_0 + S_1$$

EXPLANATION OF TABLES.

Irregular sections of earthwork may also be divided into pairs of triangles, and each pair calculated for 50 feet in length by $S = \frac{50}{24} aB$. If divided into trapezoids the computation may still be put in the form $S = \frac{50}{24} aB$. In both these cases this table evidently applies.

Where speed is desired, each quantity may be taken from the table to the nearest yard only, and two or more parts added by mental arithmetic. The precision thus secured is generally superior to that of the field measurements, where a difference of 0.1 foot in the height of any cut or fill means, commonly, several yards difference in solidity.

TABLE XXXI. Prismoidal Correction.

This table gives the correction to be applied to the "end area" solidity to secure a result strictly correct by prismoidal formula. The table gives values for $C = \frac{1}{3.24} (c_1 - c_0)(D_1 - D_0)$. In this table also the correction for 20 will be 10 times that for 2, and the correction for $\frac{2}{10}$ will be $\frac{1}{10}$ that for 2.

Example. Use data given above for Table XXX (top p. 280). The correction will be

$$\begin{aligned} C &= \frac{1}{3.24} (7.4 - 3.5) (\overline{19.6 + 15.7} - \overline{14.2 + 12.7}) \\ &= \frac{1}{3.24} (3.9) (35.3 - 26.9) \\ &= \frac{1}{3.24} (3.9) (8.4) \end{aligned}$$

$$\begin{array}{rcl} \text{from Table XXXI.} & 3.9 & 8. = 9.63 \\ & & .4 = .48 \\ & & \hline & & 10.11 \end{array}$$

$$\begin{array}{rcl} \text{From Example Table XXX.} & V_{e100} & = 476.8 \\ & \text{from above } C & = 10.1 \\ \text{Correct Solidity} & = V_{p100} & = \overline{466.7} \end{array}$$

If the section be 80 feet long instead of 100, the correct result will be $466.7 \times 0.8 = 373.36$ and for any length in direct proportion.

The multiplication by 0.8 can best be made, as just above, *after applying the correction.*

EXPLANATION OF TABLES.

TABLE XXXII. Earthwork for various bases and for slope $1\frac{1}{2}$ to 1.

It applies only to regular "Three Level Sections." Each table gives for any center height two quantities under columns L or K . Column L gives the solidity in cubic yards of a level section 50 feet in length and of the given center height. Column K gives a quantity to be used in connection with the side heights. The figure from column K is to be multiplied by the difference between (a) the sum of the side heights, and (b) twice the center height, or $K(h_r + h_l - 2c)$ and the result is to be added or subtracted depending upon whether the arithmetical sum of the side heights is greater or less than twice the center height.

Example. Sta. 1 $\frac{15.7}{-5.8} - 7.4 \frac{19.6}{-8.4}$

Base 14 feet 0 $\frac{12.7}{-3.8} - 3.5 \frac{14.2}{-4.8}$

Slope $1\frac{1}{2}$ to 1

Sta. 0	3.5	$L = 124.8$	$K = 11.3$	$3.8 = h_l$
		18.1	1.6	$4.8 = h_r$
		142.9	678	8.6
			113	$7.9 = 2c$
			18.08	1.6

Sta. 1	7.4	$L = 344.0$	$K = 16.8$	5.8
		- 10.1	- 0.6	8.4
		333.9	- 10.08	14.2
				14.8

$$S_0 = 142.9$$

$$S_1 = 333.9$$

$$V_{100} = 476.8$$

The results agree with those given for Table XXX. where the notes are the same.
